EXPLANATIONS

REGARDING PRONUNCIATION AND CHEMICAL SYMBOLS.

PRONUNCIATION.

In showing the pronunciation the simplest and most easily understood method has been adopted, that of re-writing the word in a different form. In doing so the same letter or combination of letters is made use of for the same sound, no matter by what letter or letters the sound may be expressed in the principal word. The key by the means is greatly simplified, the reader having only to bear in mind one mark for each sound.

	Vowels.

n,	• •	,,	sing.	Z11,	• •	· · · ·	,,	••••	azure.
٠٠,	٠.	"	birny.						

The application of this key to the pronunciation of foreign words can as a rule only represent approximately the true pronunciation of those words. It is applicable, however, to Latin and Greek words, as those languages are pronounced in England.

Accent.—Words consisting of more than one syllal receive an accent, as the first syllable of the word labor the second of delay, and the third of comprehension. T accented syllable is the most prominent part of the word being made so by means of the accent. In this dictions it is denoted by the mark '. This mark, called an accer is placed above and beyond the syllable which receives t accent, as in the words labour, delay', and comprehen'sion.

Many polysyllabic words are pronounced with two a cents, the primary and the secondary accent, as the wo excommunication, in which the third, as well as the fif syllable is commonly accented. The accent on the fif syllable is the primary, true, or tonic accent, while that the third is a mere euphonic accent, and consists of a slig resting on the syllable to prevent indistinctness in the utt ance of so many unaccented syllables. Where both accent are marked in a word, the primary accent is thus marked and the secondary, or inferior one, by this mark ', as in t word excommu'nica''tion.

CHEMICAL ELEMENTS AND SYMBOLS.

By means of chemical symbols, or formulas, the composition of the most complicated substances can be v easily expressed, and that, too, in a very small compass. An abbreviated expression of this kind often gives, in single line, more information as to details than could be given in many lines of letterpress.

When any of the above symbols stands by itself it indicates one atom of the element it represents. Thus, H stands for one atom of hydrogen, O for one atom of oxygen, and Cl for one atom of chlorine. (See Atom, and Atomic theory under Atomic, in Dictionary.)

When a symbol has a small figure or number und written, and to the right of it, such figure or number in cates the number of atoms of the element. Thussignifies two atoms of oxygen, S_5 five atoms of sulphur, ϵ C_{10} ten atoms of carbon.

When two or more elements are united to form a cher cal compound, their symbols are written one after other, to indicate the compound. Thus— H_2O means wat a compound of two atoms of hydrogen and one of oxyge $C_{12}H_{22}O_{11}$ indicates cane-sugar, a compound of twe atoms of carbon, twenty-two of hydrogen, and eleven oxygen.

These two expressions as they stand denote respective a molecule of the substance they represent, that is, smallest possible quantity of it capable of existing in free state. To express several molecules a large figure prefixed, thus: $2\,H_2O$ represents two molecules of was $4(C_{12}\,H_{22}\,O_{11})$ four molecules of cane-sugar.

When a compound is formed of two or more compound the symbolical expressions for the compound are usual connected together by a comma; thus, the crystallismagnesic sulphate is $Mg\,SO_4$, $7\,H_2O$. The symbols may abe used to express the changes which occur during chemication, and they are then written in the form of an equation, of which one side represents the substances as the exist before the change, the other the result of the reaction $2\,H_2 + O_2 = 2\,H_2O$ expresses the fact that two modules of hydrogen, each containing two atoms, and one oxygen, also containing two atoms, combine to give molecules of water, each of them containing two atom hydrogen and one of oxygen.

SCREAM

SCREW

Scream (skrem), v.i. [Comp. Icel. skramsa, to scream; probably imitative, like screech. shriek, &c.] 1. To cry out with a shrill voice; to utter a sudden, sharp outcry, as in a fright or in extreme pain; to utter a the ball with a strict to be sharp outcry. shrill, harsh cry; to shrick

I heard the owl scream and the crickets cry.

Shak.

So sweetly screams if it (a mouse) comes near her, She ravishes all hearts to hear her. Swift.

She ravishes all hearts to hear her.

2. To give out a shrill sound; as, the railway whistle screamed.

Scream (skrëm), n. 1. A shriek, or sharp shrill cry uttered suddenly, as in terror or in pain. 'Screams of horror rend the affrighted skies.' Pope.—2. A sharp, harsh sound. 'The scream of a madden'd beach dragg'd down by the wave.' Tennyson.

Screamer (skrëm'er), n. 1. One that screams.

2. A name given to two species of South American grallatorial birds, the Palamedea cornuta and Chauna chavaria. They are remarkable for their harsh and discordant voices, and for the sharp hard spurs with which the wings are armed. See Palame.

remarkable for their harsh and discordant voices, and for the sharp hard spurs with which the wings are armed. See PALAMEDEA.—3. Something very great; a whacker; a bouncing fellow or girl. [Slang.]

Screaming (skrëm'ing), p. and a. 1. Crying or sounding shrilly.—2. Causing a scream; as, a screaming farce, one calculated to make the audience scream with laughter.

Scree (skrē), n. [Let. skritha, a land-slip on a hill-side.] An accumulation of loose stones at the base of a cliff or precipice; a talus: used also as a plural in same sense. Grey cairns and screes of granite. 'Kingsley. 'A great scree... of coarse blocks.' Mackinder.

Before I had got half way up the screes, which gave way and ratiled beneath me at every step.

Screech (skrēch), v. i. [A softened form of screak (which see), Icel. skrækja, skrækta, to screech, skrækr, a screech, Sw. skrika, Dan. skrige, to screech: an initative word; comp. Sc. scraich, Gael. sgreach, W. ysgrechiaw, to screech.] To cry out with a sharp, shrill voice; to scream; to shriek. 'The screechowl screeching loud.' Shak.

These birds of night... screeched and clapped their wings for a while.

These birds of night . . . screeched and clapped their wings for a while.

Bolingbroke.

Screech (skréch), n. 1. A sharp, shrill cry, such as is uttered in acute pain or in a sudden fright; a harsh scream. 'The birds obscene... with hollow screeches.' Pope.

A spreach or shrick is the cry of terror or passion; perhaps it may be called sharper and harsher than a scream; but, in human beings especially, scarcely to be distinguished from it.

C. Richardson.

be distinguished from it. C. Richardson.

2. A sharp, shrill noise; as, the screech of a railway whistle.

Screech-owl (skrēch'oul), n. An owl that utters a harsh, disagreeable cry at night, formerly supposed to be ominous of evil; an owl, as the barn-owl, that screeches, in opposition to one that hoots.

The owl at Freedom's window scream'd,
The screech-owl, prophet dire. Churchill.

Screechy (skrēch'i). a. Shrill and harsh; like a screech. Cockburn.

Screed (skrēd), n. (Prov. E. screed, a shred, A. Sax. screede, a shred. See next entry.] In platering, (a) a strip of mortar of about 6 or 8 inches wide, by which any surface about to

be plastered is divided into bays or compartments. The screeds are 4, 5, or 6 feet apart, according to circumstances, and are accurately formed in the same plane by the plumbrule and straight-edge. They thus form gauges for the rest of the work, the interspaces being latterly filled out flush with them. (b) A strip of wood similarly used.

Screed (skred), n. [A form of shred; a Scotch word. See above.] 1. The act of rending or tearing; a rent; a tear. Burns.—2. That which is rent or torn off; as, a screed of cloth.

A biece of noetry or prose: a harangue: a be plastered is divided into bays or compart-

or tearing; a rent; a tear. Burns.—2. Inat which is rent or torn of; as, a screed of cloth.

3. A piece of poetry or prose; a harangue; a long tirade upon any subject.—A screed o' drink, a drinking bout. Sir W. Scott.

Screed (skröd), v.t. [Sc. See the noun.] 1. To rend; to tear.—2. To repeat glibly; to dash off with spirit. Burns.

Screeket (skrök), v.i. Same as Screak.

Screen (skrön), n. [O.Fr. escren, escrein, escran, Fr. écran, a screen, perhaps from O.H.G. skranna, a bench, a table.] 1. An appliance or article that shelters from the sun, rain, cold, &c., or from sight; a kind of movable framework or partition, often hinged so that it may be opened out more or less as required, or be folded up to occupy less space, used in a room for excluding cold, or intercepting the heat of a free. Your leafy screens. Shak.

Our fathers knew the value of a screen From sultry suns.

Comper.

2. That which shelters or protects from

That which shelters or protects from danger; that which hides or conceals, or which prevents inconvenience.

Some ambitious men seem as screens to princes in matters of danger and envy.

Bacon.

3. A kind of riddle or sieve; more especially, (a) a sieve used by farmers for sifting earth or seeds. (b) A kind of wire sieve for sifting

Builder's Screen

sand, lime, gravel, &c. It consists of a rectangular wooden frame with wires traversing it longitudinally at regular intervals. It is propped up in nearly a vertical position, and the materials to be sifted or screened are thrown against it, when the finer particles pass through and the coarser remain. A similar apparatus is used for separating lump coal from the small coal and dross, and also for sorting crushed ores, &c.—4. In arch. (a) a partition of wood, stone, or metal, usually so placed in a church

as to shut out an aisle from the choir, a private chapel from a transept, the nave from the choir, the high altar from the east end of the building, or an altar tomb from a public passage of the church. See PAR-CLOSE. (b) In medieval halls, a partition extending across the lower end, forming a lobby within the main entrance doors, and having often a gallery above. (c) An architecturally decorated wall, inclosing a courtyard in front of a building.—5. Naut. the name given to a piece of canvas hung round a borth for warmth and privacy.

Screen (skrën), v.t. [From the noun.] 1. To shelter or protect from inconvenience, injury, or danger; to cover; to conceal as,

jury, or danger; to cover; to conceal; as, our houses and garments screen us from cold; an umbrella screens us from rain and the sun's rays; to screen a man from punish-

Back'd with a ridge of hills, That screen'd the fruits of th' earth. Milton.

ment.

That screen'd the fruits of th' earth. Millon.

2. To sift or riddle by passing through a screen; as, to screen coal.

Screening-machine (skrën'ing-ma-shën), n. An apparatus, having a rotary motion, used for screening or sifting coal, stamped ores, and the like.

Screenings (skrën'ingz), n. pl. The refuse matter left after sifting coal, &c.

Screigh-of-day (skrëch-ov-dā), n. [Comp. D. krieken van den dag, peep of day; krieken, to peep, to chirp.] The first dawn. [Scotch.]

Screw (skrö), n. [Same word as Dan. skrue. Sw. skruf, Icel. skrifa, D. schroef, O.D. schroeve, L.G. schruwe, G. schraube, a screw. Or perhaps from O. Fr. escroue, the hole in which a screw turns, Mod. Fr. escroue, which Littré regards as from one or other of the above words, but Diez, rather improbably, derives from L. scrobs, scrobis, a trench. The word does not appear very early in English. Shakspere uses the verb, and no doubt the noun was familiar before this.] 1. A cylinder of wood or metal having a spiral ridge (the thread) winding round it in a uniform manner, so that the successive turns are all exactly the same distance from each other, and a corresponding spiral groove is produced. The screw forms one of the six mechanical powers, and is simply a modification of the inclined plane, as may be shown by cutting a piece of paper in the form of a right-angled triangle, so as to represent an inclined plane, and applying it to a cylinder with the perpendicular side of the triangle of the triangle of the plane, if the triangle be then rolled about the cylinder, the hypotenuse which represents the length of the plane will trace upon the surface of the cylinder. triangle be then rolled about the cylinder, the hypotenuse which represents the length of the plane will trace upon the surface of the cylinder a spiral line, which, if we suppose it to have thickness, and to protrude from the surface of the cylinder, will form the thread of the screw. The energy of the power applied to the screw thus formed is transmitted by means of a hollow cylinder of equal diameter with the solid or convex one, and having a spiral channel cut on its inner surface so as to correspond exactly to the thread raised upon the solid cylinder. Hence the one will work within the other, and by turning the convex cylinder, while

the other remains fixed, the former will pass through the latter, and will advance every revolution through a space equal to the distance between two contiguous turns of the thread. The convex screw is called the external or male, and the concave or hollow screw the internal or female screw, or they are frequently termed simply the screw and nut respectively. As the screw is a medification of the inclined plane it is not difficult to estimate the mechanical adnot difficult to estimate the mechanical ac-vantage obtained by it. If we suppose the power to be applied to the circumference of the screw, and to act in a direction at right angles to the radius of the cylinder, and parallel to the base of the inclined plane by which the screw is supposed to be formed; then the power will be to the resistance as the distance between two contiguous threads to the draymfarence of the cylinder. But the distance between two contiguous threads to the circumference of the cylinder. But as in practice the screw is combined with the lever, and the power applied to the extremity of the lever, the law becomes: The power is to the resistance as the distance between two contiguous threads to the circumference described by the power. Hence the mechanical effect of the screw is incommerce described by the power. Hence the mechanical effect of the screw is increased by leasening the distance between the threads, or making them finer, or by lengthening the lever to which the power is applied. The law, however, is greatly modified by the friction, which is very great. The uses of the screw are various. It is an invaluable mechanism for fine adjustments such as are required in good telescopes, microscopes, micrometers, &c. It is used for the application of great pressure, as in the screw-jack and screw-press; as a borer, in the gimlet; and in the ordinary screw nail we have it employed for fastening separate pieces of material together. — Archinedean screw. See Archinet Evolution.

**Right and left screw, a screw of which the screw or perpetual screw. See under ENDLESS.

-Right and left screw, a screw of which the
threads upon the opposite ends run in different directions.—Hunter's screw consists
of a combination of two screws of unequal
fineness, one of which works within the
other, the external one being also made to
play in a nut. In this case the power does
not depend upon the interval between the
threads of either screw, but on the difference between the intervals in the two
screws. See Hunter's Screw, and Differstraid screw under Differential.—Screw screws. See HUNTER'S SCREW, and Differential screw under DIFFERENTIAL.—Screw propeller, an apparatus which, being fitted to ships and driven by steam, propels them through the water, and which, in all its various forms, is a modification of the common screw. Originally the thread had the form of a broad spiral plate, making one convolution

round the spindle or shaft, but now it conround the spindle or shaft, but now it consists of several distinct blades. The usual position for the screw propeller is immediately before the stern-post, the shaft passing parallel to the keel, into the engine-room, where it is set in rapid motion by the steamengines. This rotatory motion in the surrounding fluid, which may be considered to be in a partially inert condition, produces, according to the well-known principle of the screw, an onward motion of the vessel more or less ranid according to the velocity. the screw, an onward motion of the vessel more or less rapid, according to the velocity of the shaft, the obliquity of the arms, and the weight of the vessel. The annexed figure shows a somewhat rare form of the screw propeller.—Screw nads and wood werees, a kind of screws very much used by carpenters and other mechanics for fastened with the stress of any metalial to. penters and other mechanics for tastering two or more pieces of any material together. When they are small they are turned by means of an instrument called a screw-driver.—Screw werench or key, a method of the screw-driver and over the turn large chanical instrument employed to turn large screws or their nuts.—2. One who makes a sharp bargain; an extortioner; a miser; a

skin-flint. -8. An unsound or broken-down horse. [Colloq.]—4. A small parcel of to-bacco twisted up in a piece of paper, somewhat in the shape of a screw.—5. A steam-vessel propelled by means of a screw.—6. A screw-shell (which see).

His small private box was full of peg-tops . screws, birds eggs, &c. T. Hughes.

7. The state of being stretched, as by a screw. 'Strained to the last screw he can bear.' Couper.—8. Wages or salary. [Slang.]—A screw loose, something defective or wrong with a scheme or individual.

My uncle was confirmed in his original impression that something dark and mysterious was going forward, or, as he always said himself, that there was a screw loose somewhere.

Dickens.

-To put on the screw, to bring pressure to bear (on a person), often for the purpose of getting money.—To put under the screw, to influence by strong pressure; to compel; to coerce.

Screw (skrö), v.t. 1. To turn, as a screw; to apply a screw to; to move by a screw; to press, fasten, or make firm by a screw; as, to screw a lock on a door; to screw a press.

2. To force as by a screw; to wrench; to squeeze; to press; to twist.

I partly know the instrument

That screws me from my true place in your favour.

Shak.

We fail!
But screw your courage to the sticking-place,
And we'll not fail.
Shak.

3. To raise extortionately; to rack. 'The rents of land in Ireland, since they have been so enormously raised and serewed up.' 'The Swift.—4. To oppress by exactions; to use violent means towards. 'Screwing and racking their tenants.' Swift.

In the presence of that board he was provoked to exclaim that in no part of the world, not even in Turkey, were the merchants so screwed and wrung as in England.

Hallam.

5. To deform by contortions; to distort. 'Grotesque habits of swinging his limbs and screwing his visage.' Sir W. Scott.

He screw'd his face into a harden'd smile. Dryden.

Screw (skrö), v.i. 1. To be oppressive or exacting; to use violent means in making exactions. 'Whose serewing iron-handed administration of relief is the boast of the parish.' Howitt.—2. To be propelled by means of a screw. 'Screwing up against the very muddy boiling current.' W. H. Russell

Screw-bolt (skrö'bölt), n. Screw-bolt (skrö'bölt), n. A square or cylindrical piece of iron, with a knob or flat head at the one end and a screw at the other. The real line of the handle is that which passes through both the hands, and ends at the head of the blade. This may be a straight line or a crocked one, generally the latter, and by moving these handles up or down the main handle, each mower can place them so as best suits the natural size and position of his body. For laying cut corn them so as best suits the natural size and position of his body. For laying cut corn evenly, a cradle, as it is called, may be used. The cradle is a species of comb, with three or four long teeth parallel to the back of the blade, and fixed in the handle. Fig. 2 the blade, and fixed in the handle. Fig. 2 shows a species of scythe which has been called the cradle-scythe, as it is regularly used with the cradle for reaping in some localities. It has a short branching handle somewhat in the shape of the letter Y, having two small handles fixed at the extremities of the two branches at right angles to the plane in which they lie. The Hainault scythe is a scythe used with only one hand, and is employed when the corn is much laid and entangled. The person has a hook

in one hand with which he collects a small bundle of the straggling corn, and with the scythe in the other hand cuts it.—2. A

origin doubtful.] The name given generally to mammals of certain genera belong-

ing to the order Carnivors and to the section Pinnigrads, which differ from the typical carnivorss merely in points connected with their semisquatic mode of life. The seals are divided into two families—the Phoolds, or common seals, which have no external ear; and the Otarids, or eared seals, which include the sea-bear, sea-lion, and other forms. Species are found in

Hooded or Crested Seal (Cystophora cristata).

Almost every sea out of the limits of the tropics, but they especially abound in the seas of the arctic and antarctic regions. The body is elongated and somewhat fishlike in shape, covered with a short dense fur or coarse hairs, and terminated behind by a short conical tail. The Phocidæ have their hind-feet placed at the extremity of the body, and in the same line, so as to serve the purpose of a caudal fin; the fore-feet are also adapted for swimming, and furnished each with five claws. They are largely hunted for their fur and blubber, a valuable oil being obtained from the latter; and to the Esquimaux they not only furnish food for his table, oil for his lamp, and clothing for his person, but even the bones and skins supply material for his boats and his summer tents. There are nunerous species. The common seal (Phoca victulina) is not uncommon on British coasts. It averages about 4 feet in length, and its fur is grayish-brown, mottled with black. It is easily tamed, and soon becomes attached to its keeper or those who feed it. Closely allied to the common seal is the marbled seal (P. discolor) found on the coast of France. The P. greenlandica (harp-seal or saddleback seal) forms the chief object of pursuit by the seal-fishers, and has its familiar name from a black or tawny mark on the back, resembling a harp in shape, the body fur being gray. The great seal (P. barbata) measures from 8 to 10 feet in length, and occurs in southern Greenland. The gray seal (Halichærus griseus) frequents more southern regions than the preceding, and attains a length of from 8 to 9 feet. The smallest of the Greenland seals, P. fatida, is so called because of the disagreeable odour emitted by the skin of old males. A species of the genus Phoca, known as the P. capica, is found in the Caspian Sea, and also in the Siberian lakes Aral and Baikal. The created seal (Cystophora cristata) is common on the coasts of Greenland, &c. The so-called creat is a bladder-like bag capable of being inflated with air from the animal's nostrile. T a simil cauching ear, and the neck is much better defined than in the Phocids. They are also able to move about on land with greater ease, owing to the greater freedom of the fore-limbs. The best known forms are the Otaria ursina (sea-bear) and Otaria quotat (sea-lion). The famous under fur which forms the valued 'seal-skin' is obtained from species of the Otarids. See SEA-BEAR, SEA-ELEPHANT, SEA-LION.

Self (self). [A.Sax. self, selfa, a pronominal word common to the Teutonic tongues; O. Sax. self, D. zelf, Dan. selv. Icel. sidlfr, G. selb. selbst, Goth. silba; probably formed by compounding the reflexive pronoun se, si (=L. se), seen in Icel. ser, to himself, sik, self, G. sich, with some other word. In the oldest English (A. Sax.) as well as later self was a kind of pronominal adjective, most commonly used after the personal pronouns, but also, in the sense of same, standing before nouns, quite like an adjective. Thus the following forms occur: ic self, or ic selfa, I myself; min selfes, of myself; nie selfa, this selfa, thyself; he selfa himself; the selfa, thyself; he selfa himself; the latter being undeclined, as ic me self, I myself; he him self, he himself; and these forms gradually led to the forms myself; hyself, ourself, yourself, &c., in which the genitive or possessive form is prefixed to self. After this it was not unnatural for self to be often regarded as a noun with the plural selfs also per like other nouns ending in f. In him. tive or possessive form is prefixed to self. After this it was not unnatural for self to be often regarded as a noun with the plural selves, like other nouns ending in f. In himself, themselves, the old dative is still retained.] A pronominal element affixed to certain personal pronouns and pronominal adjectives to express emphasis or distinction; also when the pronoun is used reflexively. Thus for emphasis, I myself will write; I will examine for myself. Thou thyself shall be carried; it shall be resent itself. Reflexively, I ablor myself; he loves himself; it pleases itself; we value ourselves. Except when added to pronouns used reflexively, self serves to give emphasis to the pronoun, or to render the distinction expressed by it more emphatical. I myself will decide, not only expresses my determination to decide, but the determination that no other shall decide. Himself, herself, themselves, are used in the no-minative case, as well as in the objective. Jesus himself baptized not, but his disciples.

Sometimes self is separated from my, thy, cometimes set is separated from my, thy, &c., as, my wretched self; 'To our gross selves' (Shak.); and this leads to the similar use of self with the possessive case of a noun; as, 'Tarquin's self' (Shak.), giving self almost the character of a noun, which it fully takes in such cases as are illustrated in next article. in next article.

The British Pharmacopooia recognizes two kinds of senna, the Alexandrian and the Tinnevelly. Alexandrian senna (Senna Alexandrian) consists of the lance-shaped leaflets of C. lanceolata and the obovate ones of C. obovata, carefully freed from the flowers, pods, and leaf-stalks. It is grown in Nubia and Upper Egypt, and imported in large bales from Alexandria. It is liable to be adulterated by an admixture of the leaves, flowers, and fruit of the argel (Solenostemma Argel). Tinnevelly or East Indian senna (Senna Indica) is a very fine kind, and consists of the large lance-shaped leaflets of C. clongata. The leatlets of C. obovata are from their shape called also blunt-leaved menna, and from their place of export, Aleppo senna. shape called also built-leaved sering, and from their place of export Aleppo serina. The true serina leaves are distinctly ribbed and thin, and generally pointed, and are readily distinguished from the leaves of argel by their unequally oblique base and their freedom from bitterness. Senna is a general and efficient laxative in cases of occasional or habitual constipation. Given

alone it occasions griping and nausea; it is therefore best administered with aromatics or with neutral laxative neutral laxative salts, which at the same time increase its activity. It is used in dyspepsia and in febrile and and in febrile and infammatory dis-eases; but, as it is sometimes drastic, it must be avoided when the alimentary canal is much affected.—Bladder senna, the Coutea arborescens, a native of the south of Eurone and em. of Europe, and em- Senna (Cassia lanceolata). ployed to adulter-

Sensation (sen-sä'shon), n. [Fr. sensation, from L. L. sensatio, sensationis, from L. sensation, sensationis, from L. sensation, sensationis, from L. sensation, sensationis, from L. sensation, sensation of the sense of the body of the sense of the sensorium by something acting on the organs of sense; feeling produced by external objects, or by some change in the internal state of the body; a feeling; as a sensation of light, heat, heaviness, &c. Sensations are conveyed by means of nerves to the brain or sensorium. An impression produced by something external to the body is sometimes spoken of as an external sensation; when it proceeds from some change taking place within the living system, and arising from its own actions, it is termed an internal sensation; thus the impression communicated to the mind by the effect of light on the retina, and the painful sensations; the feeling of hunger and of restlessness are internal sensations. The external organs by which those impressions which cause sensations are primarily received are called the organs of the senses; these are the eye, the ear, the nose, the tongue, palate. &c., which constitute the organ of taste, and the extremittes of nerves, dispersed under the common integuments, which give rise to the common sensation, feeling or touch. In addition to these, according to Professor Bain, the feelings connected with the movements of body, or the action of the muscles, have come to be re-

cognized as a distinct class, differing materially from the sensations of the five senses. They have been regarded by some metaphysicians as proceeding from a sense apart, a sixth or muscular sense, and have accordingly been enrolled under the general head of sensations. That they are to be dealt with as a class by themselves, as much so as sounds or sights, the feelings of affection, or the emotions of the ludicrous, is now pretty well admitted on all hands.—2. The power of feeling or receiving impressions through organs of sense; as, inorganic bodies are devoid of sensation.

hardly fair. Farrar Sensationary (sen-sā'shon-a-ri), n. Possessing or relating to sensation; sensational. Sense (sens), n. [L. sensus, sensation, a sense, from sentio, sensum, to perceive by the senses (whence sentence, consent, dissent, assent, &c.); 1. One of the faculties by which man and the higher animals perceive external objects by means of impressions rade on assent.&c.) 1. One of the faculties by which man and the higher animals perceive external objects by means of impressions made on certain organs of the body. The senses enable us to become acquainted with some of the conditions of our own bodies, and with certain properties and states of external things, such as their colour, taste, odour, size, form, density, motion, &c. A sense is exercised through a specialized portion of the nervous system, capable of receiving only one series or kind of impressions. The senses are usually spoken of as being five in number, namely, sight, hearing, taste, smell, and touch; and each of them is exercised in the recognition of an impression conveyed along some nerve to the brain. Some physiologists, however, recognize a sixth of muscular sense arising from the sensitive department of the fifth pair and the compound spinal nerves. (See under SENSATION.) Others again treat of a seventh or visceral sense, a term which they apply to the instinctive sensations arising from the ganglionic department of the nervous system.—2. Perception by the senses or bodily organs; sensation; feeling. "Burn out the sense and virtue of mine eye." Shak.

Sept (sept), n. [Probably a corruption of sect.] A clan, a branch of a race or family: used particularly of the races or families in

Ireland.

The terms 'tribe' and 'sept' are indifferently used by many writers on Irish antiquities; but Sir Henry Maine thinks the first applies to the larger unit of the above description, and the second to the minor groups it includes. . . . The sept was known by a second name, the Fine or Family, and it was evidently a distinct organic group in the main connected by the ties of blood, and claiming descent from a common ancestor, yet certainly containing other elements introduced by adoption and like processes. In this respect it had much affinity with the Roman 'Gens' and the Hellenic' House'; and it was singularly like the Hindoo' Joint Family' united in kindred, worship, and estate, and one of the earliest monads of Aryan life.

First tel me whider I shal (go) and to what man Chancer.

Al drery was his chere and his loking Whan that he sholde out of the chambre go

As an auxiliary: (a) to express mere fu 2. As an auxiliary: (a) to express mere rurity, forming the first persons singular and plural of the future tense (including the future perfect), and simply foretelling or declaring what is to take place—am to, are to; as, I or we shall ride to town on Monday. This declaration simply informs and the shall right that the place of focuses. day. This declaration simply informs another of a fact that is to take place. Of course there may be an intention or determination in the mind of the speaker, but shall does not express this in the first person, though will does, I will go, being equivalent to I am determined to go, I have made up my mind to go. Hence, I will be obliged, or we will be forced, to go is quite wrong. The rest of the simple future is formed by the auxiliary will; that is to say, the future in full is, I shall, thou will, he will, we shall, you will, they will. In indirect narrative, however, shall may express mere futurity in the second and third persons in such sentences as, he says or thinks he shall go. (b) In the second and third persons shall implies (1) control or authority on the part of the speaker, and is used to express part of the speaker, and is used to express a promise, command, or determination; as, you shall receive your wages; he shall re-ceive his wages; these phrases having the force of a promise in the person uttering them; thou shalt not kill; he may refuse to go, but for all that he shall go. (2) or it implies necessity or inevitability, futurity thought certain and answered for by the speaker.

Sorrow on love hereafter shall attend. Shak. He that escapes me without some broken limb shall acquit him well. Shak.

(c) Interrogatively, shall I go? shall we go? shall be go? shall they go? ask for direction or refer the matter to the determination of the person asked. But shall you go? asks rather for information merely as to the future without referring to another's intention. (d) After conditionals, as if or whether, ord, in dependent clauses generally shall. and in dependent clauses generally, shall, in all the persons, expresses simple futurity;

(I shall say, or we shall say, If Thou shall say, ye or you shall say, He shall say, they shall say.

Whosoever (=if any one) therefore shall break one of these least commandments, and shall teach men so, he shall be called the least, &c. Mat. v. 19.

(e) Should, though in form the past of shall, is not used to express simple past futurity; thus, I shall go, means I am to go, but we do not say I should go yesterday, for I was to go or to have gone yesterday. In the indirect speech, however, it is so used; as, I said I should go; I arranged that he should

Macaulay.

Should is very commonly used (1) to express

Should is very commonly used (1) to express present duty or obligation, as I, we, they should (now and always) practise virtue; or to express past duty or obligation; as, lave paid the bill on demand; it was my duty, your the should they have paid the bill on demand, but it was not you should You should) paid.

(2) To express a merely hypothetical case or (2) To express a merely hypothetical case or a contingent future event, standing in the same relation to would that shall does to will; thus, as we say I shall be glad if you would come, so we say I should be glad if you would come. In such phrases as, if it should rain to-morrow, if you should go to London next week, if he should arrive within a month, it is to be regarded as the future subjunctive. In like manner should is used after though, grant, admit, allow, &c. (3) It adjunctive. In like manner should is used after though, grant, admit, allow, &c. (3) It is often used in a modest way to soften a statement; thus, 'I should not like to say how many there are, 'is much the same as I hardly like, I do not like; so I should not care if I were at home' = I do not. Similarly, 'It should not saw 'often is rearly the same 'of were at home'=I do not. Similarly, 'It should seem' often is nearly the same as

'it seems'—but this expression is now less common than 'it would seem.'

He is no suitor then? So it should seem

Shall and will are often confounded by in-accurate speakers or writers, and even writers such as Addison sometimes make a writers such as Addison sometimes make a slip. In quoting the following lines from a song in Sir George Etherege's 'She Would if she Could' (1704), Mr. R. Grant White says, 'I do not know in English literature another passage in which the distinction between shall and will and would and should is at once so elegantly, so variously, so precisely, and so compactly illustrated.'

How long I shall love him I can no more tell. Than, had I a fever, when I should be well. My passion shall kill me before I well show it, And yet I would give all the world he did know it; But oh how I sigh, when I think should be woo me, I cannot refuse what I know would undo me.

It is a pity that shame/ast and shame/astness...
should have been corrupted in modern use to shame-faced and shame/acadness. The words are properly of the same formation as steadfast, steadfastness, sooth/ast, sooth/astness, and those good old English words now lost to us, rooffast, rooffastness. As by rooffast our fathers understood that which was firm and fast by its root, so by shamfast, in like manner, that which was established and made fast by (an honourable shame. To change this into shame-faced is to allow all the meaning and force of the word to run to the surface, to leave us, ethically, a far inferior word.

Shark (shärk), n. [Usually derived from L. carcharias, Gr. karcharias, a shark, from karcharos, sharp-pointed, with sharp or jagged teeth; but the want of intermediate forms renders this etymology a little doubtful. Perhaps from A. Sax. sceran, to shear, to cut. Comp. Icel. skerthingr, a shark. The noun and the verb appear to have been applied to persons as early as to the fish.] 1. One of a group of elasmobranchiate fishes, celebrated for the size and voracity of many of the species. The form of the body is elongated, and the tail thick and fieshy. The mount is large, and armed with several rows of compressed, sharp-edged, and sometimes serrated teeth. The skin is usually very rough, covered with a multitude of little osseous tubercles or placoid scales. They are the most formidable

and voracious of all fishes, pursue other marine animals, and seem to care little whether their prey be living or dead. They often follow vessels for the sake of picking up any offal which may be thrown over-board, and man himself often becomes a victim to their rapacity. The sharks formed the genus Squalus, Linn., now divided into

The common word for mutilus is castrated. I. A ruminant animal of the genus Ovis, family Capridæ, nearly allied to the goat, and which is among the most useful species of animals to man, as its wool constitutes a principal material of warm clothing, and its flesh is a great article of food. The skin is made into leather, which is used for various purposes. The entrails, properly prepared and twisted, serve for strings for various musical instruments. The milk is thicker than that of cows, and consequently yields a greater relative and consequently yields a greater relative quantity of butter and cheese. The sheep is remarkable for its harmless temper and its timidity. The varieties of the domestic sheep (Ovis aries) are numerous, but it is not certainly known from what wild species these were originally derived. Some at any rate of the domesticated breeds, more espe-cially the smaller short-tailed breeds, with crainty the smatter short-tained breeds, with a crescent-shaped horns, appear to be descended from the wild species known as the Mouffon (which see). The principal varieties of the English sheep are the large Leicester, the Cotswold, the South-down, the Cheviot, and the blackfaced breeds. The Leicester comes early to maturity, attains a great size, has a fine full form, and carries great size, has a nine tunt form, and carries more mutton, though not of finest quality, in the same apparent dimensions, than any other; wool not so long as in some, but con-siderably finer—weight of fleece 7 to 8 lbs. siderably finer—weight of fleece 7 to 8 lbs. The Cotswolds have been improved by crossing with Leicesters. Their wool is fine, and mutton fine-grained and full-sized. Southdowns have wool short, close, and curled; and their mutton is highly valued for its flavour. They attain a great size, the quarter often weighing 25 to 30 lbs, and sometimes reaching to 40 or 50. All the preceding require a good climate and rich pasture. The Cheviot is much hardier than any of the preceding, and is well adapted for the green, grassy hills of Highland districts.

Broad-tailed Sheep (Ovis laticauda).

The wool is short, thick, and fine. They possess good fattening qualities, and yield excellent mutton. The black-faced is hardi-

est of all, and adapted for wild heathery hills and moors. Its wool is long but coarse. but its mutton is the very finest. The Welsh resembles the black-faced, but is less. Its mutton, too, is delicious, but its fleec weighs only about 2 lbs. The foreign breeds of sheep are exceedingly nunerous, some of the more remarkable species being (a) the broad-tailed sheep (Ovis laticauda), common in Asia and Egypt, and remarkable for its large heavy tail, often so loaded with a mass of fat as to weigh from 70 to 80 lbs.; (b) the Iceland sheep, remarkable for having three, four, or five horns; (c) the fat-rumped sheep of Tartary, with an accumulation of fat on the rump, which, falling down in two great masses behind, often entrely conceals the tail; (d) the Astrakhan or Bucharian sheep, with the wool twisted in spiral curls, and of very fine quality; (e) the Wallachian or Cretan sheep, with very large, long, and spiral horns, those of the females at

The word passed into the Romance tongues from the Teutonic, our skiff being re-borrowed from the Fr. esquif; so also equip. Probably connected with shape. Icel. skapa, to shape, skipa, to arrange, order. Some derive it from root signifying to dig or hollow out, whence L. scapha, Gr. skaphē, a bowl, a boat, a skiff; Gr. skaphē, to dig.] I. A vessel of some size adapted to navigation: a general term for vessels of whatever kind, excepting boats. Ships are of various sizes and fitted for various uses, and receive various uses, and receive various uses, and receive various uses. excepting boats. Ships are of various sizes and fitted for various uses, and receive various names, according to their rig and the purposes to which they are applied, as manufactured to the control of purposes to which they are applied, as man-of-war ships, transports, merchantmen, barques, brigs, schooners, luggers, sloops, xebecs, galleys, &c. The name, as descrip-tive of a particular rig, and as roughly im-plying a certain size, has been used to de-signate a vessel furnished with a bowspir-t and three masts—a main-mast, a fore-mast, and a mizzen-mast—each of which is com-posed of a lower-mast, a top-mast, and a top-gallant mast, and carries a certain num-ber of square sails. The square sails on the mizzen distinguishes a ship from a barque, a mizzen distinguishes a ship from a barque, a barque having only fore-and-aft sails on the mizzen. But the development of steam navi-gation, and the fact that the sails of steam-ships are often of very small importance, have gone far towards rendering this re-stricted application of the term ship of little value. Owing to increase of size, and especially increase in length, sailing vessels may have four or more masts, and this is may have four or more masts, and this is said to have certain advantages. Up to within recent times wood, such as oak, pine, &c., was the material of which all ships were constructed, but at the present day it has been largely superseded by iron out steak largely superseded by iron out steak largely superseded. and steel: and in Britain, which is the chief ship-building country in the world, the tonnage of the wooden vessels constructed is but a fraction of that of those built of steel. The first iron vessel classed at Lloyd's was built at Liverpool in 1838, but iron barges and small vessels had been con-structed long before this. — Armed ship. Shright (shrit), n. (From its harsh, shrieking cry.) A general name applied to the members of a family (Laniide) of insessorial birds belonging to the dentirostral division of the order. The family is conveniently divided into two groups, the Laniine, or true shrikes, and the Thamnophiline, or bush-shrikes. The genus Lanius is distinguished by the broad base of the bill, which

Great Gray Shrike (Lanius excubitor)

is hooked at the tip. The nostrils, which are situated laterally, are surrounded by bristles. The fourth quill is longest in the bristles. The fourth quill is longest in the wings, and the tail is of graduated or conical shape. The great gray shrike (L. excubitor) makes its appearance in Britain during the winter. This species is coloured gray on the upper and white on the under parts; the quills of the tail being black with white tips, whilst a band of black crosses the forehead, surrounds the eyes, and terminates at the ear covers. The average length is about 9 or 10 inches. The food consists of mice, shrew-mice, small birds, frogs, and insects; and these birds have the habit of invaling shrew-mice, small birds, frogs, and insects; and these birds have the habit of impaling their prey on thorns or suspending it on the branches of trees, in order to tear it to pieces with greater ease, a habit which has obtained for them the name of butcherbirds. The red-backed shrike (Lanius or Enneoctonus collurio), a summer visitant to Britain, is our most common species. Its

Forked-tail Crested Shrike (Dicrurus cristatus)

average length is 6 or 7 inches. A popular name for it (and also for other species) is the nine-killer, from a belief that it impales

nine creatures together before beginning to eat them. The woodchat shrike (L. or E. rufus) sometimes appears in Britain. In the Thamnophiline, or tree-shrikes, the bill is long and possesses an arched keel, the tip being hooked and bristles existing at the base. Some of the species attain a length of from 12 to 13 inches. They are common in South America. The name of drongos or drongo-shrikes has been given to certain birds allied to the shrikes, and forming the family Dicruring shrikes, and forming the family Dicrurine (which see). The forked-tail crested shrike,

is variously stated, but is generally given as ten. Of these the most celebrated was the Cumæan sibyl (from Cumæ in Italy), who appeared before Tarquin the Proud offering him nine books for sale. Herefused to buy them, whereupon she went away, burned three, and returned offering the repurned three, and returned offering the remaining six at the original price. On being again refused she destroyed other three, and offered the remaining three at the price she had asked for the nine. Tarquin, astonished at this conduct, bought the books, which were found to contain directions as to the worship of the gods and the policy of the Romans. These books, or books professing to have this history, were kept with great care to have this history, were kept with great care at Rome, and consulted from time to time by oracle-keepers under the direction of the senate. They were destroyed at the burning of the temple of Jupiter. Fresh collections were made, which were finally destroyed by the Christian emperor Honorius. The Sibylline Oracles referred to by the Christian Fathers belong to early ecclesiastical literature, and are a curious mixture of Jewish and Christian material, with, probably, here and there a snatch from the probably, here and there a snatch from the older pagan source. 2. 11. In astron, a portion of the ecliptic or zodiac containing 30 degrees, or a twelfth part of the complete circle. The signs are reckoned from the point of intersection of the celiptic and equator at the vernal equinox, and are counted onwards, proceeding from west to east, according to the annual course of the sun, all round the celiptic. In printing they are represented by the following marks, which are attached to their respective names:—Aries ♈. Taurus ✕, Gemini II, Cancer Oo, Leo St. Virgo mg, Libra 📤 Scorpio M, Sagittarius 🕻 , Capricornus 19, Aquarius 2, Pisces X. The first six signs, commencing with Aries, are called northern signs, because they lie on

the north side of the equator; and the other six, commencing with Libra, are called southern signs, because they lie on the south side of the equator. The six beginning with Capricornus are called ascending signs, because the sun passes through them while advancing from the winter to the summer solties, and is consequently acquiring altitude sites, and is consequently acquiring altitude. stice, and is consequently acquiring altitude with respect to inhabitants of the northern hemisphere. The other six, beginning with Cancer, are called descending signs, because the sun in passing through them diminishes his altitude with respect to inhabitants of the northern hemisphere. These names are the northern hemisphere. These names are borrowed from the constellations of the zodiac of the same denomination, which were respectively comprehended within the foregoing equal divisions of the ecliptic at the time when those divisions were first made; but on account of the precession of the equinoxes the positions of these constellations in the leavens no larger corresponding to the leaven no larger corresponding to the leaven no larger corresponding the leaven no larger corresponding to the leaven no larger co the equinoxes the positions of these constellations in the heavens no longer correspond with the divisions of the celiptic of the same name, but are considerably in advance of them. Silene (si-le'ne), n. [Origin doubtful.] An extensive genus of plants belonging to the natural order Caryophyllaceæ. The species are in general herbaceous; the stems are leafy, jointed, branched, and frequently glutinous below each joint. The greatest proportion are inhabitants of the south of Europe and north of Africa; many occur in the temperate regions of both hemispheres. Several species are British, which are known by the names of campion and catch-fly. Many are cultivated in gardens as ornamental flowers. S. compacta or close-flowered catch-fly is one of the most beautiful of the genus. S. infacta, or bladdercampion, is edible. The young shoots boiled are a good substitute for green peas or asparagus. naracija.

parague. Silent (si'lent), a. [L. silens, silentis, ppr. of sileo. See SILENCE, n.] 1. Not speaking; mute; dumb; speechless.

O my God, I cry in the daytime, but thou hearest not; and in the night season, and am not silent. Ps. xxii. a. Her eyes are homes of silent prayer.

Sliica (sill-ka), n. [L. silex, silicis, a flint.]

(SiO₂) Oxide of silicon. This important substance constitutes the characteristic ingre-

stance constitutes the characteristic ingredient of a great variety of minerals, among which rock-crystal, quartz, chalcedony, and flint may be considered as nearly pure silica. It also predominates in many of the rocky masses which constitute the crust of our globe, such as granite, the varieties of sandstone, and quartz rock. It is the chief substance of which glass is made; also an ingredient, in a pulverized state, in the manufacture of stoneware, and it is essential in the preparation of tenacious mortar. Silica, when pure, is a fine powder, hard, insipid, and when pure, is a fine powder, hard, insipid, and

inodorous, rough to the touch, and scratches and wears away glass. It combines in definite proportions with many salifiable bases, and its various compounds are termed silicates. Plate-glass and window-glass, or, as it is commonly called, crown-glass, are silicates of sodium or potassium, and flint-glass is a similar compound, with a large addition of silicate of lead. See SILICIC.

Silicate (sil'1-kāt), n. A salt of silicic acid. Silicates formed by the union of silicic acid, or silica, with the bases alumina, lime, magnesia, potassa, soda, &c., constitute the greater number by far of the hard minerals which encrust the globe. The silicates of potash and soda, when heated to redness, form glass.—Silicate paint, natural silica, when dried and forming an almost impalpwhen dried and forming an amoust impain-able powder, mixed with colours and oil. Unlike the ordinary lead paints, all the sili-cate colours are non-poisonous. Silicate white has great covering power; is not af-fected by gases; and heat of 500° is suc-

cessfully resisted.

Silicated (sill-kāt-ed), a. Coated, mixed, combined, or impregnated with silica. — Silicated soap, a mixture of silicate of soda and hard soap.

Silicatization (sil'i-kāt-īz-ā"shon), n. The process of combining with silica so as to

change to a silicate.

Siliceous, Silicious (si-lish'us), a. Pertaining to silica, containing it, or partaking of its nature and qualities; as, siliceous limestone; siliceous slate; siliceous nodules, the siliceous coments of byte siliceous coments of byte siliceous coments.

limestone; siliceous slate; siliceous nodules, &c.—Siliceous cement, a hydraulic cement containing a certain proportion of a silicate.—Siliceous earth, silica (which see).—Siliceous earth, silica (which see).—Siliceous waters, such as contain silica in solution, as many boiling springs.
Silicic (si-lis'ik), a. Of or pertaining to silica; as, silicic ether; silicic acid.—Silicic acid, an acid obtained by decomposing sodium silicate with hydrochloric acid and dialysing the liquid so obtained. Silicic acid has not been obtained in the pure form, as it undergoes decomposition into water and silica when heated. Many silicic acids are believed to exist. The normal acid is H₄SiO₄. mal acid is H₄SiO₄.

The fine, soft thread produced by the larve of numerous species belonging otherese.] In the life, soft thread produced by the larve of numerous species belonging to the genus Bombyx and other genera of the family Bombycide, lepidopterous insects of the section popularly known by the name moth, the most important of which is the Bombyx mori, or common silkworm, a is the Bolings more, or common surveying, and inative of the northern provinces of China Silk is the strongest, most lustrous, and most valuable of textile fabrics, and is a thread composed of several fluer threads which the worm draws from two large organs or should southly in the strong organs of should southly in the strong of the strong or the strong or the strong of the strong or the st gans or glands, containing a viscid sub-stance, which extend along great part of the body, and terminate in two spinnerets at the mouth. With this substance the silk-worm envelops itself, forming what is called a cocoon. Raw silk is produced by the operation of winding off, at the same time, several of the balls or cocoons (which are immersed in hot water to soften the natural gum on the filament) on a common natural gum on the filament) on a common reel, thereby forming one smooth even thread. Before it is fit for weaving it is converted into one of three forms, viz. singles, tram, or organzine. Singles (a collective noun) is formed of one of the reeled lective noun) is formed of one of the reeled threads, being twisted in order to give it strength and firmness. Tram is formed of two or more threads twisted together. In this state it is commonly used in weaving, as the shoot or weft. Thrown silk is formed of one, two, three, or more singles, according to the substance required, twisted together in a contrary direction to that in which the singles of which it is composed are twisted. The silk so twisted is called organzine. Spun silk is waste silk, pierced cocoons, floss, &c., dressed, combed, formed organzine. Spun silk is waste silk, pierced cocoons, floss, &c., dressed, combed, formed into rovings, and spun by processes and on machinery analogous to that used in the worsted manufacture.—Tussah silk, a term applied to the raw silk produced by a variety of moths other than the ordinary silkworm, Bombyz mori.—2. At. wt. 108. 1. A metal which in its compact state is of a fine white colour and lively brilliancy. It possesses

the metallic lustre in a remarkable degree, is capable of being highly polished, and has neither taste nor smell. Its ep. gr. is about 10-68. A cubic foot weighs about 660 lbs. Its ductility is little inferior to that of gold. It is harder and more elastic than tin or gold, but less so than copper, platinum, or iron. It is superior to gold in lustre, but inferior to it in malleability; it is, however, so malleable that it may be beaten Instre, but interior to it in malleability; it is, however, so malleable that it may be beaten into leaves not exceeding the 100,000th part of an inch in thickness. It is not altered by air or moisture, but is blackened or turnished by sulphuretted hydrogen. The numerous uses and applications of silver are well known. In its pure state it is too soft for coin, plate, and most ornamental purposes, and is therefore in such cases alloyed with conner. In which in proper proportion its copper, by which, in proper proportion, its colour is not materially impaired, and it is considerably hardened. The standard silver of our coin is an alloy 222 parts of pure silver, and 18 of copper. Native silver occurs abundantly, and is generally alloyed with and 18 of copper. Native silver occurs abundantly, and is generally alloyed with gold, platinum, copper, iron, arsenic, cobalt, &c., most frequently with platinum. The ores of silver are numerous, and indeed there are few metallic ores which do not contain some traces of it. The principal ores are the following: Monochloride of silver, or hornsilver, a soft bluish gray mineral found chiefly in Chili and Fern, but also in smaller quantities in Siberia, the Hartz, Norway. Saxony, Brittany, and Cornwall; it contains about 75 per cent of silver. Argentite, vitreous sulphide of silver. Argentite, vitreous sulphide of silver, or silver-plance, a dark leaden-gray ore, with a metallic lustre when cut, found in Saxony, Bohemia, Hungary, and Mexico; it contains about 89 per cent of silver. Brittle or black sulphide of silver or stephanite, a brittle, blackismineral found at Freiberg, in Peru, and Mexico; it contains about 67 per cent of silver. Polybasite, another form of the brittle sulphide, is of an iron-gray colour, and found in Mexico; chili, Nevada, and Idaho, it contains from 64 to 72 per cent of silver. Dark-red silver over, ruby-silver, or Pyrargyrite, a widely disseminated ore, yields about 60 per cent of silver. Native amalgam, a soft mineral of a bright silver-white appearance, is found in many localities, and contains about 36 per cent of silver. Similes are like songs in love; They much describe, they nothing prove. Prior. Simile, Metaphor, Allegory, Parable, agree in implying likeness between a primary object, or the thing likened, and a secondary, ject, or the thing likened, and a secondary, or that to which it is likened. Simile asserts mere resemblance, and states what is literally true; as, man is like grass. Metaphor asserts what, taken literally, is not true, affirming the primary to be the secondary; as, all flesh is grass. Mlegory has been defined to be a continued metaphor, but improperly. Metaphor presents always both objects; allegory, the secondary only, so that its real meaning and application are only to be perceived by inference. The most characteristic feature of allegory is the personificaistic feature of allegory is the personifica-tion of abstract ideas and things without life, and the allegory generally forms an in-dependent whole of some length. Spen-ser's Faëry Queen and Bunyan's Pilgrim's Progress are the most perfect examples in modern literature. Parable is usually devoted to the inculcation of some truth or principle by means of an invented case or incident resembling or parallel to a real case, the author of the parable being thus enabled to put prominently and forcibly forward the essential points intended to be emphasized.

supplied both with lungs and external gills. They are peculiar to the southern provinces of the United States. Called also Mud-eels. 6. An instrument for producing continuous or musical sounds, and for measuring the number of sound waves or vibrations per second, which produce a note of given pitch. In its original form it consists of a disc with a circular row of oblique holes, revolving close to the top-plate of a wind-chest perforated with corresponding holes of a contrary obliquity, so that the jets of air from the latter passing through the former keep the disc in motion, and produce a note corsupplied both with lungs and external gills. trary obliquity, so that the jets of air from the latter passing through the former keep the disc in motion, and produce a note corresponding to the rapidity of the coincidences of the holes in the two plates, the number of coincidences or vibrations to a given time being shown by indices which connect by toothed wheels with a screw on the axis of the disc. From the deep piercing nature of the sound which the siren emits, a modified form of the instrument having two discs rotating with great velocity in opposite directions is employed as a fogsignal or alarm. The discs are driven by a steam-engine, which also forces a blast of steam through their apertures when those of the two discs come in opposition. The device is placed at the smaller extremity of a large trumpet, which greatly intensifies the sound. Called also Sirene.

The hard firm pieces constituting the framework which sustains the softer parts of any organism, and in most the softer parts of any organism, and in most animals transfers motion. In vertebrates the skeleton consists of bony matter, and is internal. In the crustacea, some tishes and reptiles, there is a skeleton produced by the hardening of the external integument, and consisting of shells, scales, plates, or the like. The skeleton of leaves consists of woody tissue. An internal skeleton is called an endoskeleton, and an external skeleton, like that of a tortoise, an exoskeleton. A prepared skeleton consists of the bones of an animal body, separated from the flesh and retained in their natural position or connections. When the bones are connected by the natural ligaments it is called a naturd skeleton; when by wires or any foreign substance, an artificial skeleton. Professor Owen uses the following terms to express the different modifications of bony matter in various parts of animals: (1) Neuro-skele-ton [Gr. neuron, a nerve], the deep-scated bones in relation to the nervous axis and locomotion. Sleep (slep), n. [A. Sax. sleep, O. Fris. slep, Goth. sleps, G. schlaf. See the verb.] 1. A natural and healthy, but temporary and periodical suspension of the functions of the organs of the senses, as well as of volition; that state of the animal in which the senses are more or less unaffected by external objects, and the fancy or imagination only is active. During sleep the operations of the senses are entirely suspended as regards the effects of ordinary impressions, but the purely animal functions continue in action; the heart least and the lungs respire with greater beats and the lungs respire with greater regularity, but less vigour; the stomach, the regularity, but less vigour: the stomach, the intestines, and their accessory organs digest; the skin exhales vapour, and the kidneys excrete urine. With the central nervous system, however, the case is very different; for while some parts may retain the power of receiving impressions or developing ideas, others have their actions diminished, exalted, perverted, or altogether arrested. It is on the nutritive regeneration of the tissues (more especially of the nervous tissue) which takes place during true healthy sleep that its refreshing power and value to the organism depends. The quantity of sleep required by different individuals is various, from six to nine hours being the average proportion; but persons of very active dispositions and abstemious habits will be satisfied with much less, while children and aged people require much more. The physiological causes of sleep are as yet undetermined. Sometimes used in the plural.

There are a kind of men so loose of soul That in their sleeps will mutter their affairs. Shak.

2. Death; rest in the grave.

Here are no storms, No noise, but silence and eternal sleep. Shak.

Sleep of plants, a state of plants at night —Steep of pitants, a state of plants at night when their flowers close, the leaves change their positions, and fold themselves together, while vitality seems to retire from the periphery. This is chiefly owing to the withdrawal of the stimulus of light to which they are subjected during the day. The name is also given to a similar phenomenon occurring during the day. See extract.

Occurring during the day. See Samaco.

There is another class of movements, dependent on the action of light. We refer to the movements of leaves and cotyledons which when moderately illuminated are diablehotropic, but which change their positions and present their edges to the light, when the sun shines brightly on them. These movements have sometimes been called diurnal steep.

The sense or faculty by which certain qualities of bodies are perceived through the instrumentality of the olfactory nerves; the faculty of perceiving by the nose; one of the five senses. The essential part of the organ of smell consists of the expansion of the olfactory nerves, the first or most anterior pair of the nerves issuing from the brain, whose minutest branches are distributed just beneath the mucous membrane of the nose. The air, passing through the nose, brings the effluvia or odoriferous particles of bodies into contact with the olfactory nerves, the nerves transmit the impression to the brain, by means of which it is perceived by the mind. The human organ of smell is less developed than that of some other mammalia, or even of birds. In different animals the sense than that of some other manmalia, or even of birds. In different animals the sense of smell is adapted chiefly to that class of substances on which they feed. In the choice of food, which is the main object of the sense of smell, man generally, though almost unconsciously, and animals always, exercise the precaution of smelling, and they instinctively form a judgment according to the impression received. In eating also, much of that which is commonly attributed to the sense of taste depends upon the odour of the food carried from the mouth to the nose.—2. formed in the air when the temperature of formed in the air when the temperature of the atmosphere sinks below the freezing-point. The particles of moisture contained in the atmosphere are then frozen, and form flakes, which descend to the earth. Each

flake which falls is composed of a number of minute crystals of ice, which present countless modifications of the hexagonal system. They have great diversities of density, and display innumerable varieties of the most beautiful forms. These crystals adhere together to form an irregular cluster; and consequently the incident rays of light, which are refused as reflected. light, which are refracted and reflected so as to present individually the prismatic colours, are scattered after reflection in all directions, and combine to give to the eye the colour sensation of white. When suffithe colour sensation of white. When suffi-cient pressure is applied the slightly adhering crystals are brought into true molecular ontact, when the snow, losing its white colour, assumes the form of ice. Snow answers many valuable purposes in the economy of nature. Accumulated upon high regions it serves to feed, by its gradual melting, streams of running water, which a sudden increase of water, in the form of rain, would convert into destructive torrents or would convert into destructive torrents or standing pools; and in many countries it tempers the burning heats of summer by cooling the breezes which pass over it. In severer climates it serves as a defence against the rigours of winter by protecting vegetation from the frost, and by affording a shelter to animals which bury themselves under it. Even in more temperate climates it is found that vegetation suffers more from an open winter than when the fields, during that season, lie hid beneath a snowy covering; for as snow is a slow conductor of heat a coating of it prevents the earth from parting quickly with its warmth, and at the same time protects it from the cold of the atmosphere.—Red snow. See Protococcus. 2. Something that resembles snow, as white blossoms. The scent of the elder bushes blossoms. which were spreading their summer snow close to the open window opposite.' A chemical compound of common domestic use for washing and cleansing, and also used in medicine, &c. It is a compound resulting from the combination of certain constituents derived from fats, olls, grease of various kinds both animal and vegetable, with certain salifiable bases, which in household soaps are potash and

soda. Chemically speaking soap may be defined as a salt, more especially one of the alkaline salts of those acids which are present in the common fats and oils, and present in the common rate and only and soluble soaps may be regarded as cleates, stearates, and margarates of sodium and potassium. There are many different kinds of soaps, but those commonly employed may be divided into three classes:—I. Fine white soaps, scented soaps, &c.; 2. Coarse white soaps, scented soaps, &c.; 2. Coarse household soaps; 3. Soft soaps. White soaps are generally combinations of olive-oil and carbonate of sods. Perfumes are occasionally added, or various colouring matters stirred in while the soap is semifluid. Comstirred in while the soap is semiffuid. Common household soaps are made chiefly of soda and tallow. Yellow soap is composed of tallow, resin, and soda, to which some palm-oil is occasionally added. Mottled soap is made by simply adding mineral and other colours during the manufacture of ordinary hard soap. Marine soap, which has the property of dissolving as well in saltwater as in fresh, is made of cocoa-nut oil, soda, and water. Soft soaps are generally soda, and water. Soft soaps are generally made with potash instead of soda, and whale. made with potash instead of soda, and whale, seal, or olive oil, or the oils of linseed, hemp-seed, rape-seed, &c., with the addition of a little tallow. Excellent soaps are made from palm-oil and soda. Soap is soluble in pure water and in alcohol; the latter solution jellies when concentrated, and is known in maliciated. in medicine under the name of opodeldoc, and when evaporated to dryness it forms what is called transparent soap. Medicinal soap, when pure, is prepared from caustic soda, and either olive or almond oil. It is sous, and enter once of amount of a gently aperient antacid action. -2. Socratic, Socratical (so-krat'ik, so-krat'ikal), a. Pertaining to Socrates the Grecian sage, or to his language or manner of teaching and philosophizing. The Socrate method of reasoning and instruction was by interrogatories. Instead of laying down a proposition authoritatively, this method led the antagonist or disciple to acknowledge it himself by dint of a series of questions put to him. It was not the object of Socrates to him. It was not the object of Socrates to establish any perfectly evolved system of doctrine, so much as to awaken by his discourses a new and more comprehensive pursuit of science, which should direct itself to all that is knowable. To him is ascribed two of the very first principles of science, namely, the inductive method and the defi-nition of ideas.

Socratically (sō-krat'ik-al-li), adv. Socratic manner; by the Socratic method.

Socratism (sok'rat-izm), n. The doctrines

Soda. (86'da), n. [Sp. Pg. and It. soda, glass-wort, barilla, from Ar. sucd, soda.] (Nag.0.)

The protoxide of the metal sodium, formerly called mineral alkali. It has likewise been called a fixed alkali, in contradistinction from ammonia, which is a volatile alkali. Soda, or protoxide of sodium, is formed when sodium is burned in dry air or oxygen. It is a white powder, which attracts moisture and carbonic acid from the air. When this

protoxide is dissolved in water, there is formed the true alkali or hydrate of sodium, called also caustic alkali, Na HO, which is a white brittle mass of a fibrous texture, havwhite brittle mass of a nirous texture, nay-ing a specific gravity of 1588. Caustic soda has a most corrosive taste and action upon animal substances: it dissolves readily both in water and alcohol, in the solid form it readily attracts carbonic acid from the at-mosphere, falling thereby into an efforescent mosphere, raining thereby into an emrosscent carbonate. It forms soaps with tallow, oils, wax, rosin; dissolves wool, hair, silk, horn, slumina, silica, sulphur, and some metallic sulphides. With acids soda forms salts which are soluble in water, and many of which crystallize. The carbonate of soda, which are soluble in water, and many of which crystallize. The carbonate of soda, Na₂Co₃10H₂O, is the soda of commerce in various states, either crystallized, in lumps, or in a crude powder called soda-ash. The manufacture of carbonate of soda is divided into three branches. The first process is the decomposition of sea-salt or common salt (chloride of sodium) by means of sulphuric acid; the second, the conversion of the sulphide of sodium so produced into crude carbonate of soda by strongly heating with chalk and carbonaceous matter; and third, the purification of this crude carbonate, either into a dry white soda-ash or into ate, either into a dry white soda-ash or into crystals. The chief uses of soda are in the manufacture of glass and of hard soap. The carbonate of soda is used in washing, and is a powerful detergent, although milder than carbonate of potash. It is also used in medicine. Sulphate of soda is glauber-salts. See SODIUM.

Soder (so'der), n. Solder.

Sodium (so'di-um), n. [See Soda.] Sym. Na (from Natrium). At wt. 23. The metal of which soda is the oxide, discovered by Davy in 1807. He obtained it by a process exactly similar to that by which he procured potassium, which it strongly resembles in many properties. Gay-Lussac and Thénard soon afterwards procured it in greater quantity by decomposing soda by means of fron; and Brunner showed that it may be prepared with much greater facility by distilling a mixture of sodic carbonate with charcoal: it is now prepared by the latter process in considerable quantities. Sodium is a silverwhite metal, having a very high lustre. Its sp. gr. is 0-972; it melts at 194 Fahr., and oxidizes rapidly in the air, though not so rapidly as potassium. It decomposes water instantly, but does not spontaneously take fire when thrown on water, unless the water be somewhat warm, or the progress of the globule of sodium upon the surface of the water be impeded. When heated in air or oxygen it takes fire and burns with a very pure and intense yellow flame. It is perhaps more abundant in our globe than any other metal for it constitutes two-fifths of all the sea-sait existing in sea-water, in the water of springs, rivers, and lakes, in almost all soils, and in the form of rock-sait. Sea-sait is a compound of chlorine with sodium. Sodium also occurs as oxide of sodium or soda in a good many minerals; and more especially in the form of carbonate, mitrate, and borate of soda. Soda is contained in sea plants, and in land plants growing near the sea. It occurs also in most animal fluids. The only important oxide of sodium is the protoxide known as soda. See SODA.

Soil (soil), n. [O.Fr. soil, soile, Mod. Fr. soi, from L. solum, the soil, generally taken from the root of soidus, soile]. 1. The upper stratum of the earth; the mould, or that compound substance which furnishes nutriment to plants, or which is particularly adapted to support and nourish them; earth; ground. Wherever the surface of the earth is not covered with water, or is not naked rock, there is a layer of earth more or less mixed with the remains of animal and vegetable substances in a state of decomposition, which is commonly called the soil. Soils may generally be distinguished from mere masses of earth by their friable nature and dark colour, and by the presence of some dark colour, and by the presence of some vegetable fibre or carbonaceous matter. In vegetatie fire or carroinceous matter. In uncultivated grounds soils generally occupy only a few inches in depth on the surface; and in cultivated grounds their depth is generally the same as that to which the implements used in cultivation have pene-trated. The stratum which lies immediately under the soil is called the subsoil, which is comparatively without organized matter. Soil is composed of certain mixtures or combinations of the following substances: the binations of the following substances: the earths, silica, alumina, lime, magnesia; the alkalies, potassa, soda, and ammonia, oxide of iron and small portions of other metallic of iron and small portions of other metallic oxides, a considerable proportion of moisture, and several gases, as oxygen, hydrogen, carbonic acid. Besides these every soil contains vegetable and animal matters, either partially or wholly decomposed. The analysing of soils, in order to ascertain their component parts and qualities, and their adaptation to the growth of various vegetable productions, as well as the methods of improving them by means of chemical manures, form the subject of agricultural chemistry.—2. Land; country. Leads discontented steps in foreign soil. Shak.

The frequency of solar spots attains a maximum every ten-and-ahalf years, falling off during the interval to a minimum, from which it recovers gradually to the next maximum. This periodicity has been thought to be intimately connected with meteorological phenomena.—Solar system, in astron. that system of which the sun is the centre. To this system belong the planets, planetoids, satellites, comets, and meteorites, which all directly or indirectly revolve round the central sun, the whole being bound together by the mutual attractions of the several parts. According to the Ptolemaic system, framed by the

Greek astronomer Ptolemy, the earth was an absolutely fixed centre, and the heavens were considered as revolving about it from east to west, and carrying along with them all the heavenly bodies, the stars and planets, in the space of twenty-four hours. The Copernican system, taught by Copernicus in the beginning of the sixteenth centre of the stars and the stars and the stars are started to the stars and the stars are started to the stars are started to the started t The Copernican system, taught by Copernicus in the beginning of the sixteenth century, represents the sun to be at rest in the centre of the universe, and the earth and the several planets as revolving about him as a centre, while the moon and the other satellites revolve about their primaries. The heavens and fixed stars were supposed to be at rest, and their apparent diurnal motions were imputed to the earth's motion from west to east. Notwithstanding the defects of this system it produced a powerful effect, and prepared the way for the discoveries of Galileo, Kepler, and Newton. The Tychonic system, propounded by Tycho Brahé, the Danish astronomer, in the latter part of the sixteenth century, represented that the earth was fixed in the centre of the universe, and that round it revolved the sun and moon, while the planets revolved directly round the sun. Brahé's observations were of immense service to his contemporary Kepler in discovering the famous laws which ultimately led Newton to the grand theory of universal gravitation. (See KEPLER'S LAWS.) The Neutonian system, so named as being adopted by Sir Isaac Newton, is the only one admitted in modern astronomy. It is frequently called the Copernican system, from its rejecting what Copernicus rejected; but it is far from receiving all that Copernicus received. In this system there is no fixed centre, the sun only approximating to that character from its greater magnitude. The orbits of the this system there is no fixed centre, the sun only approximating to that character from its greater magnitude. The orbits of the planets, which all revolve round the sun, are ellipses, of which the elements vary.— Solar telegraph, a telegraph in which the rays of the sun are projected from and upon mirrors. soldering (sol'der-ing), n. The process of uniting the surfaces of metals, by the intervention of a more fusible metal, which being melted upon each surface, serves, partly by chemical attraction, and partly by cohesive force, to bind them together. The alloy force, to bind them together. The alloy used as a solder must not only be more fusible than the metal or metals to be united, but must also have a strong affinity for them. The solder usually contains a large proportion of the metal to which it is to be applied, in combination with some more easily fusible metal. The surfaces to be united must be made perfectly clean and free from oxide. This is commonly effected by scraping the surfaces; and in order that the formation of any oxide may be prevented during the process, borax, sal ammoniac, or rosin is used, either mixed with the solder or applied to the surfaces.—Autogenous soldering is the union of two pieces of metal without the intervention of any solder, by fusing them at the point of junction by jets of flame from a gas blowpipe or by other means.

Same as Cubic measure.—Solid square (milit.), a square body of troops; a body in which the ranks and files are equal.—Solid problem, a problem which cannot be constructed geometrically, that is by the intersections of straight lines and circles, but requires the introduction of some curves of a higher order, as the ellipse, parabola, and hyperbola, which, being the sections of solids, give rise to the term solid problem. The algebraic solution of a solid problem leads to a cubic or biquadratic equation. problem. The algebraic solution of a some problem leads to a cubic or biquadratic equa-tion.—Syn. Hard, strong, compact, firm, dense, impenetrable, cubic, substantial, stable, sound, valid, true, real, just, weighty,

profound, grave, important.

Solid (sol'id), n. 1. A firm compact body; a body the cohesion of whose particles is so nouy the conesion of whose particles is so strong that they move in a combined mass and retain their relative positions. A solid is thus distinguished from a liquid, whose parts or particles yield to the slightest im-pression, and are easily made to move amongst each other. In solids the attractive forces of the particles are greater than the forces of the particles are greater than the repulsive, and the particles consequently adhere with greater or less force; in liquids the attractive and repulsive forces are balanced, and in gases the repulsive forces prevail.

2. In geom, a body or magnitude which has three dimensions—length, breadth, and thickness, being thus distinguished from a surface, which has but two dimensions, and saryace, which has but one. The boundaries of solids are surfaces.—Regular solids are those which are bounded by equal and regular planes. All other solids are called irregular,—3. In anatomy and medical science

Solmization, Solmization (sol-miz-ā'shon),

n. [From the syllables sol, mi.] In music, the act or art of giving to each of the seven notes of the scale its proper sound or relative pitch; an exercise for acquiring the true intonation of the notes of the scale, first by singing them in regular gradation upwards and downwards, and then by skips over wider intervals, an acquirement of the first importance to the learner of vocal music. To facilitate this various expedients have been devised, the most popular being have been devised, the most popular being the association of the several sounds with the association of the several sounds with certain syllables, such as ut, re, mi, fa, sol. la, said to have been first used by Guido of Arezzo in the eleventh century—an additional syllable, si, for the seventh of the scale, being introduced at a much later date. These seven syllables are still used by the French, but the Italians substituted do for ut, which was objected to as wanting euphony. According to some musical systems do, re, mi, fa, sol, la, si are respectively.

tively equivalent in absolute pitch to the notes C, D, E, F, G, A, B of the natural scale (that of C), but according to others they are used as the names of the first, second, third, used as the names of the first, second, third, &c., note of scales founded on any note, do being always the first, tonic, or key note. In the tonic sol-fa method these syllables are thus modified—doh, ray, ms, fah, soh, lah, te. See TONIC SOL-FA.

Solution (sō-lū'shon), n. [L. solutio, from solvo, to loosen, melt, dissolve. See Solve.] 1. The act of separating the parts of any body; disruption; breach; as, a solution of continuity. The phrase solution of continuity is specifically applied in surgery to the separates. ation of connection or connected substances or parts, as by a fracture, laceration, &c.—2. The transformation of matter from either the solid or the gaseous state to the liquid state by means of a liquid called the solvent, or sometimes the menstruum; the combi-nation of a liquid with a liquid or a gas to nation of a liquid with a liquid or a gas to form a homogeneous liquid; the state of being dissolved. When a liquid adheres to a solid with sufficient force to overcome its cohesion, the solid is said to undergo solu-tion, or to become dissolved. Thus sugar or salt are brought to a state of solution by water, camphor or resin by spirit of wine, silver or lead by mercury and so on Soluwater, campinor or resin by spirit or wine, silver or lead by mercury, and so on. Solution is facilitated by increasing the extent of surface in a solid, or by reducing it to powder. Heat also, by diminishing cohesion, favours solution; but there are exceptions to this rule, as in the case of lime and tions to this rule, as in the case of lime and its salts, water just above the freezing-point dissolving nearly twice as much lime as it does at the boiling-point. If a solid body be introduced in successive small portions into a definite quantity of a liquid capable of dissolving it, the first portions disappear most rapidly, and each succeeding portion dissolves less rapidly than its predecessor, until solution altogether ceases. In such cases the forces of adhesion and cohesion balance each other, and the liquid is said to be saturated. Various solids dissolve in the same liquid at very different rates; thus to be saturated. Various solids dissolve in the same liquid at very different rates; thus baric sulphate may be said to be insoluble in water; calcic sulphate requires 700 parts of water for solution; potassic sulphate, 16; magnesic sulphate, 15. When water is saturated with one salt it will dissolve other salts without increase of bulk. It sometimes happens that the addition of a second solid will displace the first already in solution.—3. The liquid produced as result of the process or action above described; the preparation made by dissolving a solid in a the process or action above described; the preparation made by dissolving a solid in a liquid; as, a solution of salt, a solution of salt, soda, or alum; solution of iron, &c.—Chemical solution, a perfect chemical union of a solid with a liquid, in accordance with the laws of definite proportions.—Mechanical solution, the mere union of a solid with a liquid in such a manner that its aggregate form is changed without any alteration of the chemical properties of either the solid or its solvent; thus copper dissolves in nitric acid, but only after conversion by the acid into nitrate of copper; sugar dissolves in water without undergoing any chemical change.—Mineral solution. See under MINERAL.—4. The act of solving, or the state of being solved, explained, cleared the state of being solved explained, cleared up, or removed; resolution; explanation; as, the solution of a difficult question in morality; the solution of a doubt in casuistry.

Something yet of doubt remains,
Which only thy solution can resolve. Milton.

Sonnet (son'et), n. [Fr. sonnet, from It. son-netto, a dim. from L. sonus, a sound. See SOUND.] 1. A form of verse of Italian origin, SOUND.] 1. A form of verse of Italian origin, consisting of a short poem of fourteen lines, two stanzas of four verses each, called the octave, and two of three each, called the sestette, the rhymes being adjusted by a particular rule. The octave of the propersonnet consists of two quatrains, the rhymes of which are restricted to two—one for the first, fourth, fifth, and eighth lines; the other for the second, third, sixth, and seventh. In the sectette which is commonly made up of two sestette, which is commonly made up of two tercets, the rhymes may be two or three, va-riously distributed. The sonnet generally consists of one principal idea, pursued through the various antitheses of the differ-ent strophes. The lightness and richness of ent stropnes. The lightness and richness of the Italian and Spanish languages enable their poets to express every feeling or fancy in the sonnet; but with us it has been found most suitable to grave, dignified, and con-templative subjects.—2. 1. That which is heard; the effect which is produced by the vibrations of a body affecting the ear; an impression, or the effect of an impression, made on the organs of hearing by the vibrations of the sir or other ing by the vibrations of the air or other medium with which these organs are in contact, which vibrations are caused by the vibrations or tremulous motions of the the vibrations or tremulous motions of the sounding body; noise; report; as, the sound of a trumpet or drum; the sound of the human voice; a horrid sound; a charming sound; a sharp sound; a high sound; a loud sound; a sound sound; a loud sound; a sound sound. No body can emit a sound unless it be put into a tremulous or vibratory motion; and hence sound, considered with respect to the sounding body, consists of a motion of vibration impressed on the natts of the hody; this motion is communication. parts of the body; this motion is communicated to the air which surrounds the body. cated to the air which surrounds the body, and produces in it corresponding undulations, by which the ear being affected the sensation of sound is produced. The propagation of sound is not instantaneous, that is to say, the sensation is not produced at the same instant as the motion in the sonorous body which causes it; for if a gun or a piece of ordnance be discharged at a considerable distance the flash will be first seen, and after some seconds have elapsed the report will be heard. In like manner lightning always precedes thunder, and if the thunder is toloud be at a considerable distance several seconds will elapse before the thunder is sheard. It has been ascertained that the velocity of sound through air at 0° Centigrade is about 1090 feet per second. The velocity is modified by such causes as the wind, and is affected by the temperature, oressure, and humidity of the air at the time. Sound is propagated or radiates from the sounding body in all directions and in straight lines, and diminishes in intensity as it recedes from the sounding body; so that at different distances from the body it is inversely as the squares of those distances. that at different distances from the body it is inversely as the squares of those distances. When sound is arrested in its progress by a smooth, hard, or elastic surface, as a rock, the wall of a house, of a cavern, or of a vault, it is thrown back or reflected, and thus forms what is called an echo, the law of the reflection being that the angle of reflection is always equal to the angle of incidence. Sounds are usually classified under the two heads of noises and musical sounds. A musical sound is caused by a regular series of exactly similar disturbances or pulses sucof exactly similar disturbances or pulses succeeding each other at precisely equal intervals of time. If these conditions are not fulfilled the sound is a noise. Musical sounds differ in intensity, in pitch, and in quality: intensity depends upon the amplitude of the vibrations; pitch depends upon the number of vibrations in a stated time (sound is audible, as a general rule, when the number of vibrations are more than 16 and less than 36,000 per second); the quality of a sound depends on the configuration or internal structure of the individual sound-waves. See ACOUSTICS.—2. Noise without signification; empty noise; noise and nothing else.

Making no attempt to analyse the notion of space,
. It will be sufficient for present purposes to say
that we know space as an ability to contain bodies. I
am aware that this is no definition properly so called,
seeing that as the words 'contain' and 'bodies' both
imply ideas of space, the definition involves the thing
to be defined. But leaving out as irrelevant all considerations of the mode in which we come by our
ideas of space, and of bodies as occupying space, it
will I think be admitted that the autithesis between
bodies and an ability to contain bodies ruly represents the contrast in our conceptions of the sensible
non-ego (matter) and the insensible non-ego (space).

2.† A public spectacle or exhibition; a show. Shows and species serve best with the people.

3. A class, collection, or assemblage of things or beings classified or associated according or beings classified of associated according to attributes or properties which are determined by scientific observation; as, (a) a group of animals or plants which generally bear a close resemblance to each other in the more essential features of their organization, which we would be the properties of the control of the properties of the control of which produce fertile progeny, and which may, in the generality of cases, produce indi-viduals varying from the general type of the group, the variation, however, being in all cases of a limited kind. Under this definition the various species, 'kinds' of animals and plants, and their included varieties may be comprehended; and this mode of stating the idea of species at the same time leaves the great question of the 'origin of species,' raised chiefly by Darwin and his followers, raised chiefly by Darwin and his followers, an open one, and one which must be left for future observers to settle. Up till a recent time naturalists regarded species as unchanging throughout the longest succession of ages, except within narrow and marked limits. Thus Buffon defines a species as 'a constant succession of individuals similar to, and capable of reproducing each other;' and Cuvier as 'a succession of individuals which reproduces and perpetuates itself.' (b) In mineralogy, chemistry, and such sciences as relate to inorganic substances, self. (b) In mineralogy, chemistry, and such sciences as relate to inorganic substances, species is regarded by some writers as being determined by identity of physical properties, as specific gravity, hardness, &c.; and by others, as constituted by chemical composition, the natural properties going for nothing. In scientific classification species unite to form groups called genera, which are included in orders, the orders forming classes, and so on.—4. In logic, a group of individuals agreeing in common attributes and designated by a common name; a conception subordinated to another conception, called a genus or generic conception, from which it differs in containing or comprehending more attributes, and extending to fewer individuals; thus 'man' is a species under 'animal' as a genus, and 'man' in its turn may be regarded as a genus with respect to European, Asiatic, and the like.—5. Kind; sort; variety; description; as, a coarse species of wit; a species of loth; a rare species of generosity.—8.1 Metal coined into a circulating medium; coln; specie.

A well-known and invaluable optical instrument used to assist or correct some defect in the organs of vision. tacles consist of two oval or circular lenses mounted in a light metal frame which is made up of the 'bows,' 'bridge,' and 'sides' or 'temples.' The frame is so constructed as to adhere to the nose and temples, and keep the lenses in the proper position. Spectacles which are merely fixed on the nose are usuwhich are merely fixed on the nose are usually called eye-glasses. Spectacles with convex lenses are used to aid the sight of the aged, or those who are termed long or far sighted; and spectacles with concave lenses are used to assist the vision of those who are near-sighted. In long-sighted persons the refractive powers of the eye are too feeble, or the cornea is too much flattened, hence the rays of light combus flattened. tened; hence, the rays of light coming from an object after entering the eye do not converge sufficiently soon to be brought to a verge sufficiently soon to be brought to a focus, and form a perfect image of the ob-ject on the retina. The convex lens coun-teracts this defect by increasing the con-vergence of the rays, and causing them to meet at the retina. Short-sightedness is a defect the very reverse of that which has been stated, and hence must be corrected by converte meets. defect the very reverse of that which has been stated, and hence must be corrected by opposite means, namely, by concave lenses. In both cases the value of spectacles depends upon their being accurately adapted to the state of the eye. Spectacles with coloured lenses, as green, blue, neutral-tint, smoke-colour, &c., are used to protect the eyes from a glare of light. Divided spectacles have each lens composed of two semicircles of different foci neatly united; one half for looking at distant objects, and the other for examining things near the eye. Another kind, called periscopic spectacles, has been contrived in order to allow considerable latitude of motion to the eyes without fatigue. The lenses employed in this case are either of a meniscus or concavo-convex form, the concave side being turned to the eye. Spectacles with glazed wings or frames partly filled with crape or wire-gauze are used to shield the eyes from dust, &c. Spectacles, as they form an instrument of binocular power, are usually designated a pair of spectacles.—4.†The eye; the organ of vision.

Burton. An image of something seen, continuing after the eyes are closed, covered, or turned away. If, for example, we look intensely with away. If, for example, we look intensely with one eye upon any coloured object, such as a wafer placed on a sheet of white paper, and immediately afterwards turn the same eye to another part of the paper, we shall see a similar spot, but of a different colour. Thus, if the wafer he red, the seeming spot will be green; if black, it will be changed into white. These images are also termed ocular section. These images are also termed ocular spectra. Inese images are also termed octuar spectra.

3. The oblong figure or stripe formed on a wall or screen by a beam of light, as of the sun, received through a small hole or slit and refracted by being passed through a prism. This stripe is coloured throughout prism. This stripe is coloured throughout its length, the colours shading insensibly into one another from red at the one end, into one another from red at the one end, through orange, yellow, green, blue, indigo, to violet at the other. This analysis is due to the different refrangibilities of the component rays, the violet being the most refrangible and red the least. Besides the coloured rays, the spectrum contains thermal or heating rays, and chemical rays. The heating effect of the solar spectrum increases in going from the violet to the red, and still continues to increase for a certain distance on going from the violet to the red, and some continues to increase for a certain distance beyond the visible spectrum at the red end, while the chemical action is very faint in the red, strong in the blue and violet, and sensible to a considerable distance beyond the violet end. The actinic rays, or those beyond the violet, may be rendered visible by throwing them upon a surface treated with some fluorescent substance. (See Acwith some fluorescent substance. (See AC-TINISM.) A pure spectrum of solar light is crossed at right angles by numerous dark lines, called Fraunhofer's tines (which see), each dark line marking the absorption of a particular elementary ray. By means of these dark lines and certain bright lines analogous to them, to be referred to, facts of the highest importance expecially in of the highest importance, especially in chemistry, have been ascertained. For the proper understanding of the import of these proper understanding of the important lines, five principles require to be kept in view. First, an incandescent solid or liquid to the incomplete of the inc view. First an incandescent solid or liquid body gives out a continuous spectrum. Second, an incandescent gaseous body gives out a discontinuous spectrum, consisting of bright lines. Third, each element when in the state of an incandescent gas gives out lines peculiar to itself. Fourth, if the light of an incandescent solid or liquid passes through a gaseous body, certain of its rays are absorbed, and black lines in the specare absorbed, and black mins in the substance which absorbed the ray. Fifth, each element, when gaseous and incandescent, emits bright rays identical in colour and position on the spectrum with those which it absorbs from light transmitted through it. Now, applying these principles to the solar spec-trum, we find, from the nature and position of the rays absorbed, that its light passes through hydrogen, potassium, sodium, calcium, barium, magnesium, zinc, iron, chrocium, bartium, magiesium, zinc, iron, chromium, cobalt, nickel, copper, and manganese, all in a state of gas, and constituting part of the solar envelope, whence we conclude that these bodies are present in the substance of the sun itself, from which they have been volatilized by heat. The moon and planets have spectra like that of the sun, because they shine by its reflected light, while, on the other hand, each fixed star has a spectrum peculiar to itself. It has been already said that the incandescent vapour of each elementary substance has a characteristic elementary substance has a characteristic spectrum, consisting of fixed lines, which never changes. This furnishes the chemist with a test of an exquisitely delicate nature for the detection of the presence of very minute quantities of elementary bodies. Thus, by heating any substance till it be-Thus, by heating any substance till it becomes gaseous and incandescent and then taking its spectrum, he is able by the lines to read off, as it were, from the spectrum the various elements present in the vapour. Four new elements, viz. rubidium, cassium, indium, and thallium, have thus been detected. The employment of the spectrum for the detection of the presence of elementary bodies, whether by observing the

rays they absorb or those they emit, is called spectrum or spectral analysis, and the inspectrum or spectral analysis, and the in-strument employed a spectroscope (which

Sphenophyllum (sfe-no-fil'lum), n. [Gr. sphēn, sphēnos, a wedge, and phyllon, a leaf.] A fossil genus of plants from the coal-measures, held by some to have represented the

sures, held by some to have represented the pine in the ancient world. Brongniart, on the other hand, regards the species as herbaceous plants allied to the pepper. Sphenopteris (sfe-nop'teris), n. [Gr. sphēn, sphēnos, a wedge, and pteris, a kind of fern, from pteron, a wing, a leaf.] A genus of dossil ferns, remarkable for the wedge-shaped divisions of their fronds. They occur profusely in the carboniferous system, less so in the new red sandstone and secretly at in the new red sandstone, and scarcely at

all in the greensand.

Spheno-temporal (sfe-no-tem/po-ral), a.

Relating to the sphenoid and temporal

Spheral (stë'ral), a. 1. Of or pertaining to

the spheres or heavenly bodies; inhabiting the spheres. 'The spheral souls that move through the ancient heaven of song-illumined air.' Swinburne. —2. Rounded like a sphere; sphere-shaped; hence, symmetrical; perfect. erfect.

Sphere (sfêr), n. [L. sphæra, from Gr. sphæra, a ball, a globe.] 1. In geom. a solid body contained under a single surface, which in every part is equally distant from a point called its centre. It may be conceived to be generated by the revolution of a semicircle about its diameter, which remains fixed, and which is hence called the axis of the sphere. which is hence called the axis of the sphere. A section of a sphere made by a plane passing through its centre is called a great circle of the sphere; and when the cutting plane does not pass through the centre the section is called a small circle of the sphere. A sphere is two-thirds of its circumscribing cylinder. is two-thirds of its circumscribing cylinder. Spheres are to one another as the cubes of their diameters. The surface of a sphere is equal to four times the area of one of its great circles, and the solidity is found by multiplying the cube of the diameter by 5236 or \(\frac{1}{3}\) of 7854; or by multiplying the area of a great circle by \(\frac{3}{3}\) of the diameter. 2. An orb or globe, as the sun, the earth, the stars, or planets: one of the heavenly bodies. stars, or planets; one of the heavenly bodies.

First the sun, a mighty sphere, he fram'd. Milton. 3. A circular body; a disc. [Rare.]

With a broader sphere the moon looks down. Hood.

4. An orbicular body representing the earth or the apparent heavens; a celestial or terrestrial globe.—5. In astron. (a) the concave expanse of the heavens, which appears to the eye as the interior surface of a holow expert involving the australy which to the eye as the interior surface of a hollow sphere inclosing the earth, which is placed at its centre. In this sphere all the heavenly bodies appear to be fixed, and at equal distances from the eye. It is also called the Celestial Sphere. The equator, ecliptic, meridians, &c., are circles of the celestial sphere. (b) One of the supposed concentric and eccentric revolving transparent shells in which, according to the old astronomers, the stars, sun, moon, and astronomers, the stars, sun, moon, and planets were set, and by which they were carried in such a manner as to produce their apparent motions.—6. In *logic*, the extension employment.

Every man, versed in any particular business, finds fault with these authors, so far as they treat of matters within his sphere.

Addison.

8. Rank; order of society.

Like some poor girl whose heart is set on one whose rank exceeds her own. He mixing with his proper sphere. She finds the baseness of her lot. Tennyson.

9.† An orbit; a socket.

Would harrow up thy soul, freeze thy young blood, Make thy two eyes, like stars, start from their spheres.

Make thy two eyes, like stars, start from their spheres.

—Armillary sphere, an artificial representation of the circles of the sphere, by means of rings. See ARMILLARY.—Obtique sphere, that in which the circles of daily motion are oblique to the horizon, as is the case to a spectator at any point between the equator and either pole.—Parallel sphere, that in which the circles of daily motion are parallel to the horizon. A spectator at either of the poles would view a parallel sphere.—Right sphere, that aspect of the heavens in which the circles of daily motion of the heavenly bodies are perpendicular to the horizon. A spectator at the equator views a right sphere.—Harmony or music of the spheres. See under Harmony.—Projection a right sphere.—Harmony or music of the spheres. See under Harmony.—Projection of the sphere. See Projection.

Sphere (sfer), v.t. pret & pp. sphered; ppr. sphering. 1. To place in a sphere or among the spheres.

And therefore is the glorious planet, Sol, In noble eminence enthron'd, and sphered Amidst the other. Shak.

Because I would have reached you, had you been Sphered up with Cassiopeia. Tennyson.

2. To form into roundness; to round; hence, to give perfect or complete form to.

Light from her native east To journey through the airy gloom begs Sphered in a radiant cloud; for yet the Was not.

Not vassals to be beat, nor pretty babes
To be dandled; no, but living wills and sphered
Whole in ourselves, and owed to none. Tennyson.

Sphere-born (sfer'born), a. Born among the spheres. *Millon*.

Sphere-melody (sfër'mel-ô-di), n. Melody or harmony of the spheres. See under HAR-

Sphere-music (sfer'mū-zik), n. The music or harmony of the spheres. See under HAR-MONV

MONY.

Sphereotype (sfer'ë-ō-tīp), n. [Gr. sphaira, sphere, and typos, a type or figure.] A positive collodion photograph taken on glass by placing a mat before the plate, so as to give a distinct margin to the picture. E. H. Knight. Knight.

Spheric (sfer'ik), a. Same as Spherical. E. B. Browning

Spherical (sterik, a. Same as spherical. L. B. Browning.

Spherical (sterik-al), a. [Fr. sphérique; L. sphericus. See Sphere.] 1. Having the form of a sphere; globular; orbicular; as, a spherical body.

We must know the reason of the spherical figures of the drops. Glanvil.

2. Pertaining to a sphere; belonging to a sphere. — 3. Relating to the orbs of the planets; planetary.

We make guilty of our disasters the sun, the moon and the stars, as if we were villains by necessity; fools by heavenly compulsion; knaves, thieves, and treachers by spherical predominance. Shak.

-Spherical aberration. See ABERRATION. —Spherical angle, an angle formed on the surface of a sphere by the intersection of two great circles. —Spherical excess, the excess of the sum of the three angles of a spherical triangle above two right angles or 180° the three grades of control of the spherical triangle above two right angles or 180° the three grades of covery spherical triangles. spherical triangle above two right angles or 180°, the three angles of every spherical triangle being greater than two right angles. —Spherical geometry, that branch of geometry which treats of spherical magnitudes; as, spherical triangles, arcs, and angles.—Spherical lune, a projection of the surface of a sphere included between two great semicircles having a common diameter.—Spherical polygon, a portion of the surface of a sphere bounded by the arcs of three or more great circles.—Spherical or globular projections, the projections of the circles of a sphere upon a plane.—Spherical triangle, a triangle formed on the surface of a sphere by the mutual intersection of three great circles. Spherical triangles are divided into right-angled, oblique-angled, equilateral, right -angled, oblique -angled, equilateral, isosceles, &c., as plane triangles are. —Spherisoscees, c.c., as plane triangles are—spherical trigonometry, that branch of trigonometry which teaches to compute the sides and angles of spherical triangles. See TRI-GONOMETRY.—Spherical bracketing, in arch. brackets so formed that the surface of the lath-and-plaster work which they support forms a spherical surface.

Spherically (sfer'ik-al-li), adv. In the form of a sphere. Wotton.

of a sphere. Wotton.

Sphericalness (sferik-al-nes), n. The state
or quality of being spherical; sphericity.

Sphericity (sfe-ris'i-tj), n. The state or quaity of being spherical or orbicular; globularity; roundness.

Water consists of small, smooth, spherical parti-cles; their smoothness makes them shp easily upon one another; the sphericity keeps them from touch-ing one another in more points than one. Chepne.

sphericle (ster'i-kl), n. A small sphere.

Spherics (sfer'iks), n. In geom. the doctrine of the properties of the sphere considered as a geometrical body, and in particular of the different circles described on its surface, with the method of projecting the same on a plane; spherical geometry and trigonometric.

metry.

Spherograph (sfé'rō-graf), n. [Gr. sphaira, a sphere, and graphō, to write, to describe.] A nautical instrument consisting of a stereographic projection of the sphere upon a disc of pasteboard, in which the meridians and parallels of latitude are laid down to single degrees. By the sid of this projection, and a ruler and index, the angular position of a ship at any place, and the distance salled, may be readily and accurately determined on the principle of great circle sailing.

Spheroid (sfér'oid), n. [Gr. sphaira, a sphere, and eidos, form.] A body or figure approaching to a sphere, but not perfectly spherical. In geom. a solid generated by the revolution of an ellipse about one of its axes. When the generating ellipse revolves about its

tion of an ellipse about one of its axes. When the generating ellipse revolves about its longer or major axis, the spheroid is oblomy or prolate; when about its less or minor axis, the spheroid is oblate. The earth is an oblate spheroid, that is, flattened at the poles, so that its polar diameter is shorter than its equatorial diameter. (See EARTH.) The same figure is assumed by the other planets; hence, the properties of the oblate spheroid are of great importance in geodesy and astronomy.

Spheroidal (sfe-roid'al), a. 1. Having the form of a spheroid.—2. In crystal. bounded by several convex faces.—Spheroidal bracketing, in arch. bracketing which has a spheroidal surface.—Spheroidal condition, the condition of a liquid when, on being placed on a highly heated surface, as red hot metal, it assumes the form of a more or less flattened spheroid, and evaporates without ebullition. The spheroid in this condition does not touch the surface of the metal, but ebullition. The spheroid in this condition does not touch the surface of the metal, but floats on a layer of its own vapour, and evaporates rapidly from its exposed surface. It is heated mainly by radiation from the hot surface, because conduction is impossible since the layer of intervening vapour conducts heat very feebly. The formation of a layer of non-conducting vapour explains why it is possible to dip the wetted hand into molten iron with impunity.

Spheroidic, Spheroidical (sfe-roid'ik, sfe-roid'ik, al), a. Same as Spheroida'.

rold'ik-al), a. Same as Spheroidal.

Spheroidicity, Spheroidity (sfe-roi-dis'i-ti, sfe-roi'di-ti), n. The state or quality of

sfē-roi'di-ti), n. being spheroidal.

Spherometer(sfē-rom'et-ér),n. [Gr.sphaira, a sphere, and metron, a measure.] An in-strument for measuring the thickness of

strument for measuring the unixhess of small bodies when great accuracy is required, as the curvature of optical glasses, &c.

Spherosiderite (sfe-rō-sid'er-it), n. [Gr. sphaira, a sphere, and sideros, iron.] A substance found in spheroidal masses in the basaltic compact lava of Steinheim. Called

basaltic compact law of Steinheim. Called also Glass Lawa or Hyadite.

Spherula (sferû-la), n. [L. sphærula, a little sphere.] A spherule: a term applied to the globose peridium of some plants.

Spherulate (sferû-lât), a. Covered or studded with spherules; having one or more rows of minute tubercles.

Spherule (sfer'úl), n. [See Spherula.] A little sphere or spherícal body. Mercury or quicksilver, when poured upon a plane, divides itself into a great number of minute

spherulte (sfer'ū-līt), n. [Gr. sphaira, a sphere, and lithos, a stone.] 1. A variety of obsidian or pearl-stone, found in rounded grains.—2. See RADIOLITE.

Sphere (sfer'i), a. 1. Belonging to the sphere

spheres.

She can teach ye how to climb Higher than the *sphery* chime.

Bigher than the sphery chime. Milton.

2. Resembling a sphere or star in roundness, brightness, or the like. 'Hermia's sphery eyne.' Shak.

8phex (sfeks), n. [Gr. sphēx, a wasp.] A genus of insects. Same as Anmophila.

8phincter (sfingk'ter), n. [Gr. sphinghlēr, from sphingō, to constrain, to draw close.] In anat. a name applied generally to a kind of circular muscles, or muscles in rings, which serve to close the external orifices of organs, as the sphincter of the mouth, of the eyes, &c., and more particularly to those among them which, like the sphincter ani, have the peculiarity of being in a state of permanent contraction, independently of the will, and of relaxing only when it is required that the contents of the organs which they close should be evacuated.

8phinx (sfingks), n. p.l. Sphinxes (sfingks).

Sphinx (singks), n pl. Sphinxes (singks'-ez). [Gr. sphingx, L. sphinx.] 1. In Greek myth, a she-monster, said to have proposed a riddle to the Thebans and to have killed

all who were not able to guess it. It was all who were not anie to gless it. It was at last solved by Œdipus, whereupon the sphint slew herself. In art this monster is often represented with the winged body of a lion with the breasts and head of a woman.—2. In Egyptian antiq. afigure of somewhat similar shape, having the body of a lion (seldom winged), and a human (male or female) or animal head. The human-headed figures have been called androsphinxes; those with the head of a ram criosphinxes, and those with the head of a hawk hieracosphinxes. The Egyptian sphinx was probably a purely symbolical figure, having no

A person who proposes riddles, puts puzzling or obscure questions, or who talks enigmatically.—4. A genus of lepidopterous insects, section Crepuscularia; the hawk-moths. They receive their generic name from the attitude of several of the caterpillars, which resembles that of the fabled monster so called. See SPHINGIDE. The Cynocephalus passio, or Guinea ba-

boon.

Sphingidæ (sfin'ji-dē), n. pl. A family of lepidopterous insects, section Crepuscularia. The insects belonging to this division generally fly in the evening or early in the morning, but there are many which fly in the daytime. This family embraces some of the largest European Lepidoptera, as the death's head hawk-moth, the Sphinx atropos, linn, the nivet hawk-moth (Sphinx Linns, Linn the privet hawk-moth (Sphinx Linns). Linn., the privet hawk-moth (Sphinx ligus

tri).

Sphragide (sfri'jid), n. [Fr. sphragide, from L. sphragis, sphragidis, a kind of stone used for seals; Lemnian earth; from Gr. sphragis, sphragidos, a seal. The earth is said to have been so called because sold in sealed packets.]

A species of ochreous clay, which falls to pieces in water with the emission of many bubbles. Called also Earth of Lemnos. Sphragistics (sfra-jis'tiks), n. [Gr. sphragistics (sfra-jis'tiks), n. [Gr. sphragistics, of or for sealing, from sphragis, a seal.] The science of seals, their history, peculiarities, and distinctions. The chief object of this science is to ascertain the age and genulineness of the documents to

age and genuineness of the documents to

Sphrigosis (sfri-go'sis),n. [Gr. sphrigaö, to be full of health and strength.] Over-rankness, a disease in fruit-trees and other plants, as

a disease in fruit-trees and other plants, as turnips, in which the plant tends to grow to wood or stem and leaves in place of fruit or bulb, &c., or to grow so luxuriantly that the nutritious qualities of the plant are injured, as in the potato. Sphrigosis is sometimes due to over-manuring. Sphygmic (sfig*mik), a. [Gr. sphygmos, the pulse.] Of or pertaining to the pulse. Sphygmograph (sfig*mic, graf), n. [Gr. sphygmos, a pulse, and grapho, to write.] An instrument which, when applied over an artery, indicates the character of the pulse as to the force and extent of undulations, registering them on a strip of paper moved by watch-work. It reveals in a very delicate and beautiful manner, by the tracing of a pencil on the paper, the force of the heart beats, and in making experiments with different kinds of medicines it shows their effect on the nervous system. effect on the nervous system.

enect on the nervous system. **Sphygmographic** (sfig-mö-graf'ik), a. Of or pertaining to the sphygmograph; registered or traced by the sphygmographic 'Sphygmographic tracing of the cardiac movement of (the) arterial pulse.' Dr. Caracterial pulse.' Dr. Caracterial pulse.'

Sphygmometer (sfig-mom'et-er), n. [Gr. sphygmos, a pulse, and metron, measure.] An instrument for counting the arterial pulsa-

itions; a sphygmograph.

Sphyrenide (sfi-re'ni-de), n. pl. [Gr. sphyraind.a, the hammer-fish.] A family of acanthopterygious (teleostean) fishes, nearly allied to the perches. The species are elongated, active, predaceous fishes,

having the jaws armed with formidable teeth. They live principally in tropical seas, although one or two species are found in the Mediterranean. The barracuda of the West Indies (Sphyræna picuda) is a large and powerful fish, as much dreaded as the white street. white shark.

and powerful isin, as much dreaded as the white shark.

Spisal † (spi'al), n. A spy; a scout. 'The prince's spials have informed me.' Shak.

Spica (spi'ka), n. [L., an ear of corn.] In surg. A bandage so named from its turns being thought to resemble the rows of an ear of corn.—Spica descendens, the uniting bandage used in rectilinear wounds. It consists of a double-headed roller with a longitudinal slit in the middle, 3 or 4 inches long.

Spicate, Spicated (spi'kāt, spi'kāt-ed), a. [L. spicatus, pp. of spico, to furnish with spikes, from spica, a spike.] In bot. having a spike or ear; eared like corn.

Spiccato (spik-kā'tō). [It., divided.] In music, a term which indicates that every note is to have a distinct and detached sound, and in regard to instruments played with a bow it denotes that every note is to have a distinct bow.

2. A repository of spices. 'The spicery, the cellar, and its furniture.' Addison.

Spice-wood (spis'wud). n. Lindera benzoin (Laurus benzoin, Linn.), an American shrub, the wild-alispice or benjami-tree.

Spiciferous (spi-sit'er-us). a. [L. spicifer, bearing spikes or ears, from spica, an ear, and fero, to bear.] Bearing ears, as corn; producing spikes; spicated; eared.

Spiciform (spi'si-form), a. In bot. spike-shaped.

Spicily (spis'i-li), adv. In a spicy manner; pungently; with flavour.

Spiciness (spis'i-nes), n. Quality of being

spicy.

Spick† (spik), n. A spike; a tenter.

Spick-and-Span (spik'and-span), a or adv.

[Spick, a spike, and span, a chip, a splinter.

(See SPAN-NEW.) Spick and span new means therefore nail and chip new, newly shaped and put together. Comp. I keep no antiquated stuff; But spick-and-span I have enough. Hudibras.

Spicknel (spik'nel). See SPIGNEL.
Spicose (spik'os), a. [From L. spica, a spike or ear.] Having spikes or ears; eared like corn. Written also Spicous.

Spicosity (spī-kos'i-ti), n. The state of being spicose, or of having or being full of ears, like corn.

spicous (spik'us), a. Same as Spicose.

Spicoula (spik'ū-la), n. pl. Spiculas (spik'ū-lė).

[L.] In bot. (a) a small spike or spikelet. (b) A pointed, fleshy, superficial apparadore.

penage.

Spicular (spik'ū-lėr), a. (L. spiculum, a dart.)

Resembling a dart; having sharp points.

Spiculate (spik'ū-lāt), v.t. (L. spiculo, spiculatum, to sharpen, from spiculum, dim. of spicum, for spica, a point.) To sharpen to a point. 'Spiculated paling.' W. Mason.

a point. 'Spiculated paling.' W. Mason.

Spiculate (spik'ū-lāt), a. [L. spiculatus, pot spiculo, to sharpen to a point, from spiculum, a point.] Covered with or divided into fine points; specifically, in bot. (a) covered with pointed fleshy appendages, as a surface.

(b) Applied to a spike composed of several smaller spikes crowded together.

Spicule (spik'ūl), n. [L. spicula.] 1. In bot. a spikelet.—2. In zool. one of the minute limy or flinty particles found in sponges, and also in the tissues of some coelenterate animals.

Spiculiform (spik' \dot{u} l-i-form), a. Having the form of a spicule.

form of a spicule.

Spiculigenous (spik-ū-lij'en-us), a. [L. spiculum, a dart, and gigno, genui, to produce.] Containing or producing spicules.

Spicy (spis'i), a. [From spice.] 1. Producing spice; abounding with spices.

, off at sea north-east winds blow Sabæan odours from the spicy shore Of Araby the bless'd.

2. Having the qualities of spice; flavoured

2. Having the qualities of spice; flavoured with spice; fragrant; aromatic; as, spicy plants. 'The spicy nut-brown ale.' Milton. 'Spicy gales.' Pope.—3. Having a sharp flavour; pungent; pointed; keen; as, a spicy debate.—4. Showy; handsome; smart; as, a spicy garment. [Colloq.]

Spider (spi'der), ... [For spinder for spinner, one that spins, formerly a spider; so G. spinne, a spider, from spinnen, to spin. As to the omission of n, comp. other, tooth, &c.]

1. The common name of animals of the Linnean genus Aranea, now divided not only into many genera, but into many families, into many genera, but into many families, constituting a section (Araneida) of the class Arachnida, order Pulmonaria. The head and chest are united to form a segment known as chest are united to form a segment known as a cephalothorax; no wings are developed, and breathing is effected by means of pulmonary or lung sacs. Spiders are remarkable for spinning webs for taking their prey and forming a convenient habitation. The abdomen of the spiders is unjointed, and is furnished with from four to six cylindrical or conical mammille or processes, with numberless small orifices for the passage of silky filaments of extreme tenuity, with silky filaments of extreme tenuity, with which they form their webs, and which pro-ceed from internal reservoirs. The legs number four pairs, and no antennæ are denumber four pairs, and no antennæ are developed. Their mandibles are terminated by a movable hook, flexed inferiorly, underneath which, and near its extremity, which is always pointed, is a little opening that allows a passage to a venomous fluid contained in a gland of the preceding joint. After wounding their prey with their hooked mandibles, they inject this poison into the wound, which suddenly destroys the victim. A very creat diversity exists in the modes wound, which suddenly destroys the victim.

A very great diversity exists in the modes
in which spiders construct their webs, and
in the situations in which they are placed.
Some spiders do not catch their prey by
entangling them in their webs, but roam
aboved in search of them. abroad in search of them.

My brain more busy than the labouring spider Weaves tedious snares to trap mine enemies.

Shak.

The spider's touch, how exquisitely fine! Feels at each thread, and lives along the line. Pope.

2. Something resembling or supposed to resemble a spider, as a kind of gridiron, or a trivet to support vessels over a fire.—
3. In mach. (a) a skeleton of radiating spokes, as a rag-wheel (which see). (b) The internal frame or skeleton of a gear-wheel, for instance, on which a cogged rim may be bolted, shrunk, or cast. (c) The solid interior portion of a piston to which the packing is attached, and to whose axis the pistonrod is secured. E. H. Knight.—4. Naut. (a) an iron outrigger to keep a block clear of the ship's side. (b) An iron hoop round the mast for the attachment of the futtockshrouds; also, a hoop round a mast provided with belaying pins. with belaying pins.

Spider-catcher (spi'dėr-kach-ėr), n. One who or that which catches spiders; specifically, a bird, the wall-creeper (Tichodroma muraria), found in southern Europe. Also, a genus of birds (Arachnothera) inhabiting the Indian Archipelago, whose favourite tool is spiders. food is spiders.

Spinozism (spī-no'zizm), n. The system of philosophy of Baruch Spinoza, who was born in Amsterdam in 1632 of a Jewish Portuguese family, and died at the Hague in 1677. This system is based on the idea of an original substance embracing all existence, substance in this sense meaning something very different from what we usually understand by the word. This original substance, in which all antagonism between substance, in which all antagonism between mind and matter, liberty and necessity, &c., ceases, all subjects of finite consciousness disappear, he called God; by which he understood that which has an independent existence, and the understanding of which does not require the idea of anything else. This substance is infinite, and nought else exists: it is incapable of execution subtine exists; it is incapable of creating anything material or intellectual, for all matter and mind are comprehended in itself; its attri-butes are infinite thought and infinite extension. God, this all-embracing being, can act only in accordance with the established order, for otherwise we must suppose him capable of a change of nature, or that there exists a nature different from his own. Thought and extension, spirit and matter, finite and infinite, motion and repose, good and evil, causes and effects, are attributes of this sole substance, which produces nothing but modifications of itself. All that exists is only a necessary succession of modes of being in a substance for ever the same
